Get off and running with the ON THREE O'Clock!

Let the ON THREE O'Clock
be your stop watch today!

Believe it or not, a lot of folks have plain forgotten (or never knew) that the Apple /// was designed to operate with a built-in clock and that, with a clock chip installed, SOS will automatically time stamp and date all file saves.

When the Apple /// was first released, the supplier of Apple's clock chips could not supply a working clock. As a result, the /// was supplied without a clock of any kind. Now maybe you are wondering when you list a disk directory, how the time and date magically appears.

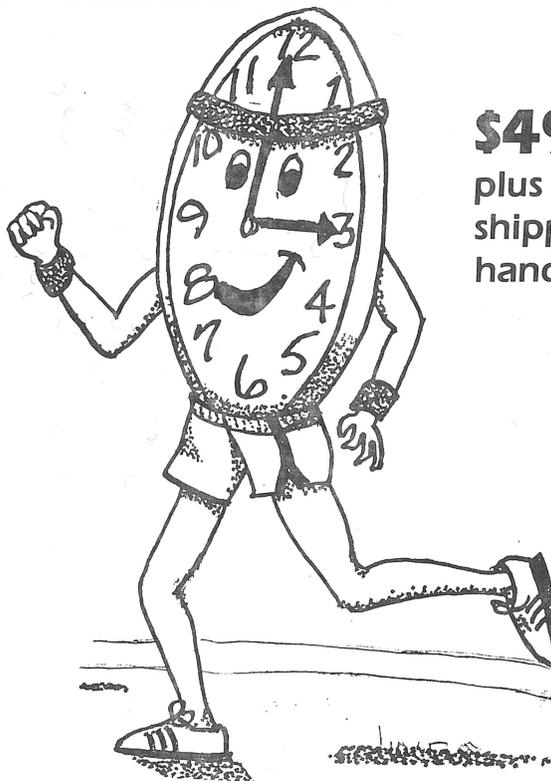

Not too long ago ON THREE developed a clock for the Apple /// which plugs in right where the never-released Apple clock was supposed to go, and for just \$49.95 plus \$3.00 shipping and handling, this easy to install, SOS-compatible clock can be yours. It comes with comprehensive instructions and ON THREE's limited six-month warranty and does not use any of your precious slots.

With an ON THREE O'Clock installed, whenever you save or modify any type of file, the current time and date will be added to the directory listing so you can always tell at a glance which file you last worked on, and when. But that's not all. Business Basic has two reserved variables, DATE\$ and TIME\$, which return, respectively, the current date and time to your BASIC program. These reserved variables can then be used whenever you want to print the date and/or time in a BASIC program.

Special Combination Offer

There's a great deal more you can do with ON THREE's ON THREE O'Clock if you also have our Desktop Manager. Whenever you want, you can display the current date and time on the screen with one keypress. Since this is a background function, you can be word processing with AppleWriter or entering data into VisiCalc, and with one keystroke you can obtain updated time information. In addition, you can use the Desktop Manager's Appointment Calendar to enter items you want to be reminded of and, like magic, when the time comes, no matter what you are doing, a message will appear on your screen to gently chide you via the Desktop Manager to make that phone call now, etc.

Now The Appointment Calendar is not the only feature of the Desktop Manager, you can read about the Calculator, the Notepad, and the others elsewhere, but since the Desktop Manager requires a clock, we want to offer you a money-saving deal. Purchased together, you can get the ON THREE O'Clock and the Desktop Manager for only \$173.95 plus \$8.00 shipping and handling. Now is the time to take advantage of this special offer.

FEATURES

The Beginning /// 7
Richard and Lavona Rann

Adding to the maintenance section of this series, the Ranns explore testing your /// for faulty chips, etc. in this month's article. Join them in the audio, video, disk, RAM and other types of testing.

Glossary of Terms 13
Rutherford B. Thompson, Jr.

Beginning this month, readers can enjoy a monthly page of complete Apple /// terminology that has never been published before. Perhaps you have forgotten some of your Apple /// terminology. Now is the time to renew your mind.

256K RAM Upgrade 19
Edward N. Gooding, Sr.

If you still are running on a 128K RAM, now is the time to upgrade rather inexpensively by following the directions given by author, Ed Gooding. This article offers complete instructions, including illustrations.

Recipe for a Menu 23
Charles G. Barton II

Have you been looking for a new cookbook recipe? Forget the cookbook, try a new BASIC recipe for a menu. Sounds silly but you can actually make a menu today. Of course, it's a program to make a menu with directions for either hard disks or floppies.

Call Three: Hot Line and User Groups 32

ON THE COVER:

APPLE /// EXPLOSION? No, just "the bombs are bursting through air" to declare that the /// is still here. As you and yours are celebrating the Fourth of July, remember the warm wishes from *ON THREE*. (Artwork by Don Sheppard)

Disk of the Month

What is the ultimate time-saver? Why *ON THREE's* Disk of the Month diskettes, of course. Why use your precious time typing in *ON THREE* program listings when they are available on diskette for just \$14.95 (plus \$2 shipping and handling) each?

Better yet, mix and match. Any two or more for \$12.50 each (plus \$4 total shipping and handling). Best bet: the works.

Now is the time to start your collection of these program-filled diskettes from all issues of *ON THREE Magazine*. Bulk and group purchase rates are also available, call (805) 644-3514 to inquire about these super savers.

DOM #1—Extra Disk Space Plus!

This diskette contains all programs from volume I, nos. 1 and 2 of *ON THREE Magazine*. Included: Disk Pak1 with a program to give you four additional blocks of space on your data disks, and Disk Pak2, something you can't do without if you are a Pascal user, a convenient and easy way to list the files on a Pascal directory. Plus graphics and sound demos and more.

DOM #2—Changing Printer Characters

Here is an amazing program you won't want to miss. With it you can print to the Apple Dot Matrix and compatibles such as Imagewriter or ProWriter the same characters that are shown on your video display. Many special fonts, including fancy gothic characters, can enhance your printed output. And, it comes with complete documentation. Also on DOM #2 are the other programs from issue number 3, more graphic demos plus: a program to list files from an Apple II diskette without entering emulation mode.

DOM #3—Redefining a Keyboard

This disk is jam-packed full with programs that appeared in Volume I, No. 4 of *ON THREE*, and includes an easy-to-use program to redefine any or all keys on the Apple /// keyboard. Of particular interest is the ability to reassign the "V" to be the delete key so it can be used on AppleWriter /// and other programs. Also included are all the WPL programs, a disk formatting utility, a graphics sketching tool and still more that we don't have room to list here.

DOM #4—Emulation Patch

Volume II, No. 1 had so many great programs it took two disks, DOM's 4 and 5, to hold them all. DOM 4 has all of the Pascal programs and the *Apple II Emulation Patch*, a way to use any Apple /// Font in emulation. Also included is the Pascal startup program for *Access ///* that lets you autodial. Another fine utility is a Pascal program and UNIT to permit calculations from within the Pascal environment. Demos haven't been forgotten either with *Radiate Graphics Demo* and *Beatles Music Demo*. To top things off, we have included a number of *Draw ON* pictures you can view with the program on DOM #5

DOM #5—Access Draw ON

Here we find the BASIC startup program to autodial from *Access ///* and *Ben's SUPER Slot Machine*, along with all of the VisiCalc and WPL programs, and the *Circling Graphics Demo* which will show some of the fantastic images that *Draw ON* can create, plus still more *Draw ON* pictures, along with the *Draw ON ///Picture Demo* which you use to view *Draw ON* pictures.

DOM #6—BASIC Lister Plus!

Straight from the pages of Vol. II, No. 2 is a program which will give you perfectly formatted listings of Business Basic programs, and a Pascal program to guide and assist you in selecting noises for animation and game programs. Both the *Pascal Noisemaker* and the BASIC lister come with full documentation. We've also tossed in still more *Draw ON* pictures and some new fonts, as well. You can use the *Draw ON* viewer from DOM 5 to see them.

DOM #7—Heap Good Stuff

From Vol. ///, Nos. 1 and 2 we present a BASIC heap sort routine and demo, *IMAGEHELPER*, a neat graphics utility to simplify graphic image design, and a menu-driven program to pre-select printer codes and parameters.

DOM #8—Directory Sorting

Here is what you have been waiting for, a complete BASIC and Assembly program to take those old chopped up directories and sort them out in just the order you want. Included also is *Clean.Heads*, a Pascal program which exercises your disk drive at cleaning time and writes a program to remind you when you last cleaned heads, plus a simple utility to read a text file and find out what the contents are without having to write a program on the spot.

DOM #9—Music, Music, Music

Here is a great collection of programs from April through July, 1986. *Music Maker* and *Music Player* let you create and play your own Merry Melodies with alternate sets of DATA statements in BASIC. *Energy Plotter* not only plots energy consumption graphs, but contains techniques to "roll your own." In addition you will find a space game, graphics images and an assembly language subroutine to find maximum and minimum values in an integer array.

DOM #10—Editing Character Sets

A great Pascal program to download and modify or create new fonts, this editor makes child's-play out of designing new text characters to meet your specific needs. Special math signs, foreign alphabets, you can do them all. *Football Pool* is a BASIC program to print out a grid for that office pool. All you do is type in the teams, the scores, and the participants; it does the rest. What? 3-D Video? Yes, indeed, *Stereo Spiral* shows how, using simple Business Basic subroutines. For the more technically inclined, the assembly subroutine *Pixel Inverter* does just that. Also included is *Prompt Procedure*, a collection of Pascal and assembly demos to write to the screen, and a couple of programs in WPL (Word Processing Language) to be used with AppleWriter.

Apple.Sauce

by Paula Sheppard

Is telecommunications for you?

Why telecommunications?

Have you been considering diving into telecommunications, but didn't know whether or not you wanted to get your feet wet? Most recently, the number of programs available for /// telecommunications has been increasing. Within the last few months, two Apple /// communications packages have been added to the market, including *ON THREE's* Communication Manager which is now available for \$49.95 plus \$3 shipping and handling.

In April's edition of *ON THREE*, Rodney Hendricks explained the basics of telecommunicating. In May and June, we read the Data Capture /// review by Edward Gooding. So this month, each of us can examine our own use of the /// and decide whether or not telecommunicating is worth investing in.

How does a modem allow me to expand?

To begin with, a modem allows you to talk to other computers with modems. For instance, if you are managing a physician's office which has three satellite offices in nearby cities and a longtime patient is moving to a city in which you have a satellite office, his records need to be transferred there. It is much more convenient to telecommunicate and have his records sent on the /// to the satellite office than to wait for the records to be sent through the mail.

Another plus for telecommunicating is the fact that you *do* have the ability to send and transfer files to other computers, besides the ///. Let's say you have a friend in another state but never seem to be in the mood to call or write, well if both of you have a modem and the correct communications programs, you can communicate with your friend on your ///. That also comes in handy when you are having trouble talking due to having a cold. No one will hear a word you say, they'll just see it printed on the screen.

If you're having problems with your /// and it is late in the evening (past *ON THREE's* office hours) try CompuServe's special Apple /// forum online to contact any knowledgeable /// user who will most likely be glad to assist you.

Through communicating with other computers, you are allowed to expand your capabilities both at the office and home. In your office, once you begin using a modem, you'll wonder how you ever managed without one. At home, too, you'll find it exciting to talk back and forth on your computer.

Speed

When deciding if telecommunications is for you, it is important to keep in mind the speed and accuracy gained when using a modem. The speed alone will come in handy in various ways. For instance, let's say today is your mother's birthday but you had completely forgotten it until you checked your Desktop calendar for appointments. Don't fret because she lives five states away from you. Through CompuServe's *Home Shopping and Banking* services you can send her a dozen roses and they'll be delivered that day. No embarrassment, no hassles. Your mother will never know that you didn't remember her birthday until the last minute. It also comes in handy when you don't have time to go to the flower shop or just really don't want to.

Have you ever wanted to be able to read the morning paper without having a huge newspaper take up half of your desk or breakfast table? Read it at work. That's right. Through CompuServe you can also view the *Washington Post*. On CompuServe, you can also checkout the latest stock reports. All of this saves a little time each day and it is hassle-free. CompuServe is one of several information services available in the telecommunications business.

Another thing to consider is telecommunications vs. the U.S. Mail discussion. At work, have you had problems in the past receiving important records and files the day you need them but have been held up by the U.S. Mail? More importantly, have files ever been *lost in the mail*? With a telecommunications package, you can forget about this problem. Certainly, there may be a few times when a file is inadvertently lost but you will always have the original copy so you won't have to worry about waiting a week to see if the U.S. Mail has pulled through and delivered the files. In just a few minutes, you can send another copy of the files and know instantly whether or not the copy was received. The fretting is over.

At *ON THREE*, telecommunications comes in rather handy for putting the magazine together. For instance, author Ed Gooding recently sent me an article for publishing using the Communications Manager to access an electronic bulletin board service, *Three's Company*, that he had set up for me. It is very easy to use the system. Ed uploaded his file from his hard disk and I downloaded the file to my hard disk. In a matter of minutes, it was on my Apple ///, ready to roll. I popped into the Communications Manager once again to convert the Unknown file to an ASCII file so I could use the article for publication. Believe me, this process comes in handy for deadlines. It allows authors to spend a little more time with their articles before they are

 Can't find your ? Having a difficult time remembering where things are? ON THREE can't help  but we can help improve your ///'s memory.  to ON THREE for all of your ///'s memory needs.

That's right. You can improve your Apple ///'s memory in a matter of minutes by simply installing a 512K Memory Upgrade, specially priced as low as \$289*.

LOOK!

The 512K Memory Upgrade includes:

- Complete 24-page instruction manual.
- Ultra-fast RAMDisk Drive with demonstration programs.
- The 512K Upgrade disk which automatically adjusts your disks to utilize the 512K of memory and contains the updated version (1.2) of the System Utilities program permitting larger SOS.DRIVER files.
- The 512K Confidence Memory Program which tests all memory and ensures your 512K Memory Board is working correctly.
- ON THREE's new and improved 180 day (six month) warranty.
- And of course, an Apple /// 512K memory board with state-of-the-art, 256K memory chips.

Place your order today for the exciting, low-priced 512K Memory Upgrade.

Call toll-free: (800) 443-8877

California residents: (800) 331-1418

The 512K Memory Upgrade from ON THREE has been the ///'s best selling add-on hardware item for the last two years. And now it's even better. With the lowest price ever and a full six month warranty, *now* is the time to order your 512K Memory Upgrade.

Have you ever run out of memory in /// E-Z Pieces? Do your VisiCalc programs yearn for more memory? Have you ever had stack overflow problems with certain large programs? Do you want to use the new accessories to the Desktop Manager but can't spare the 32K of memory those utilities require?

Worry no more, because with a 512K-equipped Apple ///, all of your problems are over. Enjoy a full 414K of desktop space in /// E-Z Pieces, 442K in Advanced Visicalc, 455K in Visicalc, 456K in Apple Writer ///, 456K in Business Basic—the list goes on. Almost all** programs running under the Apple /// SOS work with the 512K Memory Upgrade.

Do you use Catalyst or Selector ///? Have you ever had problems running large programs such as State Of The Art Accounting, BPI, Omnis 3, Keystroke and Draw ON ///? These programs use all available memory in a 256K Apple ///. Since Catalyst and Selector each occupy some memory

as well, certain large programs will not work on a 256K Apple ///.

A 512K Apple /// has enough memory and room to run the largest programs available today with some to spare. You can create larger spread sheets, data bases and word processing documents. Your 512K Apple /// will be able to do things few other personal computers can.

Included free with the 512K Memory Upgrade is an ultra-fast RAMDisk. This is an optional enhancement to the 512K Memory Upgrade which allows you to use a portion of your ///'s memory as a fast RAMDisk drive. One noticeable benefit is faster program utilization, but there are many more.

The 512K Memory Upgrade is easy to install and even easier to use. It is a *replacement* memory board and, therefore, doesn't need a precious expansion slot. Hidden inside your Apple /// is a 128K or 256K memory board. Simply take out the old board and put in the new one.

Using state-of-the-art 256K memory chips, the 512K Memory Upgrade is the single most exciting add-on produced for the /// in a long, long time. Even though we have many 512K Memory Upgrades in stock, at this unbelievably low price, we're expecting temporary shortages. Order yours today.

* The purchase price is \$324 plus \$10 shipping and handling. After installing the ON THREE 512K Memory Upgrade, return your old 256K memory board for a \$25 cash rebate or a \$35 software credit.

If you have a 128K Apple ///, the cost is \$324 plus \$10 shipping and handling with no rebate. If you order a 512K upgrade for your 128K machine, please ask for the free 128K to 512K instructions. We recommend that a 128K to 512K upgrade be done by ON THREE or a registered Apple Dealer.

ON THREE will install any memory upgrade for just \$50. We offer a one day turnaround on 128K or 256K to 512K upgrades. Call for more information.

** The regular Word Juggler program works with the 512K Memory Upgrade but does not offer additional lines for your documents. An upgraded version is available which allows twice as many lines in your documents. To obtain it, please send a disk with return postage to ON THREE. However, there is one known problem with the updated Word Juggler package. It does not work with the LexiCheck spell checker option. To check the spelling of a very large Word Juggler document, you must divide it into two smaller sections.

** The program Multiplan from Microsoft does not recognize the 512K Memory Upgrade.

mailed to us. But most of all, it allows me to communicate to the author as questions about the article pop into my head. I don't need to write the author a letter and ask him specific questions, I can just read the article and immediately ask questions and get answers *without* waiting 10 days. It takes approximately five days to send a letter from coast to coast and another five days to get a response. Quite time consuming through the U.S. Mail, wouldn't you say?

Cost

Lastly, it is important to consider the cost of telecommunicating. When doing so, you must take into consideration the extent you can benefit from using a modem.

As Rodney Hendricks mentioned in his April article, you must consider purchasing a modem and a communications program. Modems are categorized according to the speed they can transfer data. A 1200 baud modem sends 120 characters per second and 2400 baud sends 240 characters per second. Hendricks recommends starting out with a 1200 baud, Hayes-compatible modem for about \$100.

When choosing a program, make sure you can get the most out of it. Six programs I would recommend that you take your time and compare the features are Access /// (by Apple Computer), Communications Manager (by *ON THREE*), Data Capture /// (by Southeastern Software), Easy Term (sold by Sun Systems Remarketing), Terminus (by Haba) and X-Modem /// (by Moore Enterprises). The cost is in the \$40 to \$100 range depending on which package you choose. Next month Ed Gooding will be reviewing *ON THREE*'s Communications Manager and Moore Enterprises' X-Modem ///, so you may want to hold off and see what he has to say about the programs.

You'll also want to use one of the information services. Here are the addresses and phone numbers of two such services that you may want to consider.

CompuServe
P.O. Box 20212
Columbus, Ohio 43220
1-800-848-8990

The Source
1616 Anderson Road
McLean, Va. 22102
1-800-336-3366

Due to the varying rates of these services each month, it would be better if users called for price quotes from CompuServe and The Source. Often the companies run specials and introductory prices. So be sure to check with them and compare prices and services.

Serious consideration

Are you ready for telecommunications? If you are not sure ask yourself these questions:

How often would I use a system to transfer files to another computer?

Would the increased speed in mail be worth the money spent for the system?

How can telecommunications help me at work?

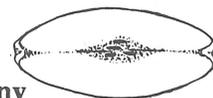

How often would I use an information service to help me with problems I encounter while using my ///?

Hopefully, this article has given you a little more insight into the telecommunications world which will help you decide whether or not it is for you. We can hear the words, "It works for me!" but it doesn't always mean that it will work for everyone. We can also hear the words, "It didn't work for me!" and be convinced it won't work for anyone. In either case, don't rely on others, just make your decision and have fun computing and/or telecomputing! 

Apple.Slices

Apple software company

Apple Computer will be developing a software company, to be headed up by William Campbell, Apple's executive vice president of U.S. sales and marketing. In early May, Apple made the announcement, saying that the software company would be separate from Apple, but would be marketing software for the Apple II and the Macintosh currently published by Apple. It will also be buying products from third parties to market and it will be developing some new products itself.

According to Apple Computer spokeswoman, Barbara Crouse, the company is "still in its organizational stage" and will remain in the Apple Complex in Cupertino, Calif. until it is fully developed. Crouse anticipates that it will be operating outside the complex within a year in the Cupertino area.

She also does not expect the company will compete with other developers as it will not carry the Apple logo and it will be a place where developers can get their software published.

Compact modems

Practical Peripherals of Westlake Village, Calif. has recently released the Practical Modem 1200 SA Mini, which is a compact, Hayes-compatible modem, designed to support virtually all communications software. If you're looking for a modem, you may want to call Practical Peripherals at (818) 991-8200.

New releases

ON THREE has released two new products since March. If you haven't heard yet, The Desktop Manager™ has an accessories disk which includes a labeler, printer setup, a new desktop setup, screen dump and a menu manager, to name a few. It is available for \$39.95 plus \$2 s/h.

Most recently, *ON THREE* released The Communications Manager™ to run with or without the Desktop Manager. The Communications Manager allows your /// to talk to other computers or services such as CompuServe™ or The Source™. You can transfer files by using Binary II or XModem. It sells for \$49.95 plus \$3 s/h.

Smart users select the **Selector ///**

The smart Program Switching utility from ON THREE

- Switch to Selector /// now
- Ideal for UniDisk or hard disk systems
- Compatible with more than two dozen major Apple /// applications
 - AppleWriter ///
 - Business Basic
 - Haba Merge
 - VisiCalc
 - /// E-Z Pieces
 - ...and more

\$99

plus \$7 s/h

Selector /// is a state-of-the art program switcher.

A program switcher is a utility that functions as your computerized personal secretary. Its purpose is to make instantly available to you, without rebooting, a wide range of applications programs stored on your hard disk or high capacity floppy (such as UniDisk). Programs such as AppleWriter ///, Quick File /// and more than two dozen others.

Each time you require a different application, just tell your personal secretary, *Selector ///*, with a couple of keystrokes, and it will be there in seconds. No need to find your way through sub-directories or paw through a stack of floppies.

When you start your system up in the morning, just boot *Selector ///* and that's it for the day. Smart users are switching to and with *Selector ///* now.

Selector /// works with all of these programs:

- | | | |

The Beginning ///

by Richard and Lavona Rann

Giving your /// a physical

A few months ago we discussed the most common mechanical problems that effect the Apple ///. In that article we talked about problems caused primarily through heat expansion, accumulation of dust and dirt, and electronic part corrosion. A number of problems can exist in anything as sophisticated as the Apple ///, and recognizing them is often difficult. In this month's column, we will look at some of the ways you can isolate and identify the root cause of many difficulties. What is needed to work along with all the suggestions we will make are: an Apple ///, a monitor (either color or monochrome, though the video tests will be slightly different with a color monitor), a blank Apple /// diskette for each disk drive to be tested, and the Apple /// Dealer Diagnostic Test program diskette. The Dealer Diagnostic disk has made its way into the public domain disk library of a number of Apple User Groups, and you can obtain it from them at a nominal cost. The first set of tests that will be covered do not require this disk.

Built-in tests

Every time the Apple /// is turned on, it performs a number of self-diagnostic tests to ensure that its hardware is function correctly. These tests form a significant part of the instructions stored in the machine's 4K of ROM. If any of these tests fail, an error message will be displayed on the screen indicating which of the six tests has failed. The messages are displayed in Figure 1.

Figure 1

Message	An error found testing
RAM	the random access memory.
ROM	the read only memory.
ACIA	the Asynchronous Communications Interface Adapter which controls the RS-232-C port.
VIA	the Versatile Interface Adapters which controls the ///s internal functions.
A/D	the Analog to Digital converter which controls the joystick.
ZP	the Zero Page function which is the addressing function.

The first of these tests is the one that the /// most commonly fails. Loose chips will usually show up in the

RAM test, even though a single faulty RAM chip will not always cause the /// to be unable to boot. This means that when the failure occurs, you may be already using an application program. This the underlying problem that usually gives you the intermittent problems that we mentioned in the prior article. A RAM failure usually indicates a contact or corrosion problem rather than a bad chip. That is good news because you can fix it yourself as explained in the prior column. In the other tests, the problems are likely to be a little harder to solve. The parts tested in the other five tests, are more commonly soldered together and a problem is likely to require a new part.

One word about software failures before we continue. There is no need to automatically assume that a system failure was caused by hardware. Software failures are every bit as likely to cause failures as hardware. Faulty reads of SOS or a program disk may cause system problems that appear to be hardware problems. A repeated failure of an application, in the same place or similar situation, usually indicates a software error. If an error situation occurs often in the same function of an application, or is repeatable, or occurs with regularity, it is almost certainly a software error rather than something wrong with your ///.

There is an easy way to look at the functioning ROM diagnostic routines. Doing this is especially important if you have experienced unexplainable problems with the ///. Severe problems with RAM chips will usually become immediately apparent when you do this test.

To begin, the Apple /// will have to be booted with no diskette in drive 1 and the drive door open. This will cause the system to fail to boot because it can't find the parts of SOS required for a boot. A **RETRY** message will appear in the upper left hand corner of the monitor. Now: *Hold down* the **OPEN APPLE CONTROL** and **RESET** keys all at the same time.

It may take the system a minute to recognize the combination. When it does a "->" prompt will appear in the upper left hand corner of the screen. The prompt indicates that you are now interacting with what is known at the *monitor* program which is stored in the ///s ROM and contains the self-diagnostic routines. In order to run this diagnostics, you must *type in* **F6E6G** then **RETURN**. This is the hexadecimal address in ROM of the diagnostic routines. The command will start the self-diagnostic and displays the results on your screen. If you make a mistake and type in something else, it is best to start over all the way back at re-starting the machine.

Several screens of testing characters and symbols in various hires modes and color will appear and disappear.

If there is any problem the general pattern will be broken. The most important feature of the ROM diagnostic is the RAM check. It appears as a block of dots eight across and eight deep for a 128K machine; a second block that will appear at the end of the test for 256 machines. Each dot represents a chip. When they are functioning properly all the chips will be represented by dots. When a chip tests as bad, the dot is replaced by a "1". A bad chip in the eighth position of the first row would look like this:

```
..... 1
.....
.....
```

The number one indicates that the chip in the upper right hand corner of the test matrix is indicating an error condition. Each dot represents a particular chip so an Apple /// repair and parts manual matrix map is needed to know where that chip is and its part number. While this level of repair will be beyond most people's interest, it does indicate the level of sophistication with which the Apple ///'s test and diagnostic system was designed. Secondly, it is the best indicator of loose or corroded chips. If the the error condition still exists after the chips have been cleaned and re-seated, then the chip can truly be assumed to be faulty.

A note for people using Titan ///+ IIe boards. When this board was installed some of the ///'s normal functions were shifted to new chips. One effect of the change is to confuse this diagnostic. The problem will not cause the boot to be aborted, but in our machine, the diagnostic shows eight bad chips in the second matrix. While there seems to be some variation between machines, the Titan ///+//e cards appear to cause most ///'s to appear to have a chip problem. If you have installed these cards, we sug-

gest that you test RAM with one of the following diagnostic disks, they do not get confused by the ///+//e.

Apple /// Dealer Diagnostic Disk

The dealer diagnostic disk covers the same ground as the internal test using many of the same tools, but in a more organized manner. It is a way to run a complete test on every system involved in the Apple ///. The disk is designed in sections so if only one area is in question, only that area need be tested. In general it is designed to diagnose failures at a modular level. A complete test will require that disk drive test diskettes be made for every drive to be tested. Those disks are generated by using a routine that is on the diagnostic disk. If a color monitor is to be used, the results will differ slightly from the results obtained with a monochrome monitor, and will have to be evaluated separately. The differences between the two monitors will be discussed as part of the particular tests where the differences arise.

Put the Dealer Diagnostic disk in drive one and boot the computer normally. As when any other disk is booted, the Apple /// will have to pass the internal ROM boot diagnostic procedure as part of the boot process. This normal boot self-diagnosis has a good side and a bad one. The good side is that every time you successfully boot your /// with any program, it indicates that the /// is basically sound. The bad side is that the checking is an all or nothing operation. Either everything works or it doesn't. That means that the tolerances of the diagnostic are set to let the /// run if things are just a little short of correct, and there is no way that you can tell. The Dealer diagnostic programs are a little fussier and let you check for other error conditions. The diagnostic menu is shown in Figure 2.

Attention subscribers!

When receiving your monthly magazine, make sure to check the mailing label! If your label has

Jul 1987

on it, it is time to renew your subscription!

ON THREE wants to make this easier by allowing you to call the toll-free order lines to do so. Just give us your name, credit card number and expiration date for renewal. Call us at **1-800-443-8877** or in **California** call **1-800-331-1418**.

When the menu appears on the screen, the **TEST ALL** option is highlighted in inverse video. Pressing return at this point will test all conditions. To test a single specific function, you can use the *arrow keys* to move the inverse video area up and down the menu to highlight your selection. Press **RETURN** to accept the highlighted option. Escape exits the diagnostic program, and the system will need to be rebooted. (It is interesting bit of trivia to note that the diagnostic program is designed for the **TAB** key to have the same function as escape for Apple II compatibility.)

Let's continue our examination of this program and your ///s health by skipping down to **MAKE TEST DISKS**. The first prompt will ask to remove the Diagnostic disk from drive one. Next it will ask that the number of the drive corresponding to drive for which a test diskette is to be prepared. Make certain that you have a blank diskette in that drive, enter the drive number (1 through 4), and press return. When the diskette is ready the system will ask if

Figure 2
Diagnostic Menu:

```

TEST ALL
VIDEO(NOT TESTED)
SOUND(NOT TESTED)
RAM MAP - 5V(NOT TESTED)
DISK(NOT TESTED)
KEYBOARD(NOT TESTED)
ROM(NOT TESTED)

RAM TEST - 12V(NOT TESTED)
MAKE TEST DISKS

Press up/down arrow to select test
RETURN to run test
Press ESCAPE to quit
  
```

another diskette is to be prepared -- n/y. "Y" for "yes" will start the process again; "N" for "no" will exit back to the main menu. Remember, that a diskette is needed for every disk drive that is to be tested and it must be prepared with that drive number of the drive to be tested.

Now that you have all your test diskettes made, let's go back and run the tests. If you took them out, put the test diskettes back in the appropriate drives, except for drive 1. Put the diagnostic diskette back in drive one and keep the test diskette for that drive handy.

TEST ALL accepts all items on the menu except the **RAM TEST** running them in order, but in exactly the same way as if they were selected individually. Let's go through them one by one.

Video tests

The video test requires that the various screen and color modes be judged subjectively by you, the operator. It is important to remember the capability of the particular monitor being used. With a monochrome monitor the Apple /// converts color images into a 16 tone gray scale; many monitors cannot handle more than 8 tones of gray at

one time. Judgment should be made on the basis of a true black, true white, and several steps between the two ends of the scale. What is important is that there are no obvious gaps in the pattern. It may not be possible to distinguish one color from another on monochrome monitors, but a tone should exist in the area.

All of the tests will display a picture of Winston Churchill in the upper left corner, and a grid of diagonal lines in the upper right corner, followed by a prompt field that covers the bottom half of the screen, "If you can read this, and the tests are clear, press space bar, otherwise, press return." In general all the tests use the commands shown in Figure 3.

Figure 3

```

space bar ---- TEST PASSES
return key ---- TEST FAILS
escape key ---- LEAVE VIDEO TESTS
left arrow ---- RETRY THE TEST
  
```

There are 13 separate tests in the video test option and they will run in order as each test is passed or failed. They are in order in Figure 4.

Audio tests

The sound capabilities of the /// have three separate tests.

- 1) Soft bell -- the speaker will beep on and off. For each sound test, press the space bar if you hear the sound; return if not.
- 2) Hard bell -- same as above at a different pitch.
- 3) DAC output -- the digital to analog converter will produce a sound at the speaker output that periodically is of zero amplitude growing in amplitude then cut back to zero. In English this means that it starts with a soft sound which grows slowly and then cuts back down.

RAM test

If you have a 256K machine, you will have to select the 5V RAM test option because the 12V option only checks up to 128K. In either case, the first RAM test is to see if the machine is addressing the amount of RAM that it should have. The second RAM test is a test of each individual bank (section) of RAM. The machine will tell you which bank number it is testing and will give you a pass or fail message when it is done with them all. Don't worry if you see a graphic screen for a while, it is normal to see it.

Disk test

Do not go into the disk test unless you have at least one test diskette made. The program is not friendly enough to let you out gracefully if you do so. (The way out, if you have already made the mistake, is to empty the internal drive before answering its request for the number of external drives to be tested, and then to enter 0. It will finally report that it failed the test.)

Dear *ON THREE*:

I own a hard disk drive but find that it takes forever to do backups. I don't have a lot of things I need to back up, but when I do need to back up, it takes a **very** long time. Do you have any suggestions?

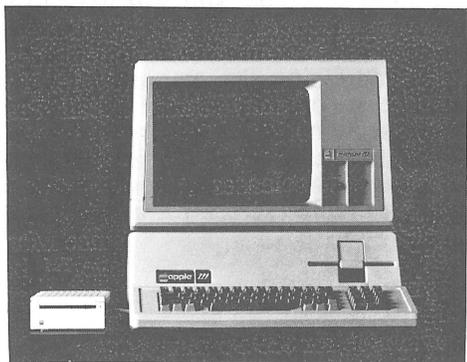

If you have had this same problem but have hesitated to call us, don't worry. *ON THREE* has just the solution!

UniDisk ///.5

The Unidisk ///.5 is an 800K 3.5 inch disk drive for the Apple ///. If you have a hard disk and hate to do backups, the Unidisk ///.5 is the ideal solution. You can backup an entire ProFile with just seven UniDisk micro-floppies. Faster than a normal disk drive, the Unidisk ///.5 is a great time-saver.

Even if you don't have a hard disk, wouldn't it be great to get rid of your regular floppy disks? The new 3.5 inch disks are great! They fit in purses, briefcases and even shirt pockets much easier than the standard 5 1/4 inch disks. With a hard plastic shell, they can take far more punishment than the easily destructible 5 1/4 inch diskettes. You can also use your diskettes on UniDisk-equipped Apple //e and //c computers.

\$499 plus \$10 s/h

The UniDisk comes complete with a drive, interface card, cabling, documentation and driver disk. Priced at a remarkably low price of \$499 plus \$10 s/h.

Figure 4 Test

- 1) Hires mode 1 -- B&W pattern.
 - 2) Hires mode 2 -- B&W pattern.
 - 3) 280 x 192 color hires mode 1 - will appear as a negative image. A color monitor will show red and black.
 - 4) 290 x 192 color hires mode 2 -- A color monitor will show a green and white or yellow pattern.
 - 5) Super hires mode 1 -- B&W pattern as in number 1.
 - 6) Super hires mode 2 -- B&W pattern as in number 1.
 - 7) A hires test 1 -- On this and test 8, the screen will be divided into four horizontal sections. The color changes from blue at the top band to green then to yellow or orange. It is difficult to see the differences on a monochrome monitor.
 - 8) A hires test 2 -- pattern as in 7.
 - 9) Color bar and gray scale test -- vertical bars of the 16 colors will appear as shades of gray on a black and white monitor, yellow/green on a monitor ///, and real colors on a color monitor. The colors left to right are: white, aqua, yellow, green, pink, gray, orange, brown, light blue, medium blue, gray, dark green, light purple, dark blue, magenta, and black.
 - 10) Apple II text mode 1 -- The screen will display:

"THE QUICK BROWN FOX JUMPS OVER THE LAZY DOGS."

 abcdefghijklmonpqrstuvwxyz

 0123456789 (in inverse)
- Lines of flashing symbols and groups of numbers complete the display.
- 11) A large two will be drawn using the 2's to form this large numeral. It will be 15 columns x 20 characters.
 - 12) Apple /// 40 column test mode -- The screen will be divided into 16 sections, one each for the 16 colors, each with the name of that color. Again monochrome monitors will not clearly depict the difference in all cases.
 - 13) Apple /// 80 column test mode -- This includes characters and numerals in normal Apple three test mode. It prints a line of text designed to take up exactly one full line on the screen. The line says: "This line of text is exactly 80 characters long and uses the entire screen width."

Once you have selected the disk test, a prompt will ask you to remove the diagnostic diskette and replace it with the test diskette for drive 1. **Do not use anything but the test diskettes made by the diagnostic program**, doing so may lose some of your important data or programs. Make sure there is a test diskette in each drive to be tested. Once the test diskettes are in the correct drives, press the return key. Now the system will ask for the number of external drives. Once you enter the number, the test will run automatically. The test ends with a summary of results for each disk drive. When the test is completed you will be prompted to re-insert the diagnostic diskette and press the return key.

Keyboard test

This test almost seems like a test of the operator as much as a test of the keyboard and the ///. The screen is not very user friendly and more than one relatively sophisticated user has reacted with a 'huh?'. Basically, the first test is to use every key on the keyboard *before* using the space bar. Each key has a representation on the screen and that representation should disappear once the key has been pressed. The instructions at the top of the page indicate how to enter some special keys. Note the representation on the screen is meant to match the order of keys on the keyboard from top to bottom and left to right. The first E means the escape key rather than the E. If you start at the left hand corner and press every key on the keyboard (except the spacebar), you will get down to the ones with special instructions.

Once you have eliminated all but the space bar, you press it and you will be asked for some special key combinations. Slow down and read the instructions carefully before pressing any key.

A test of the numeric keypad works exactly the same way as the regular keyboard test.

ROM test: This test runs automatically and will say only "PASS" or "FAIL".

Confidence Disk

There is another diagnostic disk available, the Apple /// Confidence Disk which was designed for the /// plus. This disk it is not as commonly available as the Dealer Diagnostic Disk, but is definitely useful. The Confidence Disk has a newer program, with similar functions to the Dealer Diagnostic Disk, and is much more user friendly. In fact, it talks to you. If all the tests are run and your /// passes, it will tell you through the voice circuit, "Machine status normal; I'm OK." The major functional difference between this disk and the Dealer Diagnostic Disk is that the Confidence Disk does not have the extensive keyboard test. The video test image of Winston Churchill on the older program is replaced with an image of an Apple /// in the Confidence Disk. The same video tests are performed on the new image, in exactly the same order.

The advantage to this disk is in the way it tests memory. It tests each circuit just as before, but with a graphic display of each chip on the screen. A grid of white blocks that represent the memory chips appears on the screen. A

blinking and moving apple singles the test is in progress. If a memory fault is detected: The apple stops blinking and moving, the white block corresponding to the faulty area of memory disappears, and the highlighted message, "fault detected as shown above" appears at the bottom of the screen. If this happens it is best to try the test a couple more times. Sometimes it is a fault in the test procedure rather than in memory. The memory test will continue until you stop it rather than arbitrarily stopping after one check.

The Confidence Disk has a *Continuous Test* option that is a very useful feature. It was designed to help detect the source of intermittent problems such as a corroded contact or overheating problems. The program cycles through tests 1, 2 and 3 (ROM, RAM, and Disk). It counts the number of cycles and displaying this number in the upper-right corner of the screen. The test will continue until you stop it by pressing the escape key, or until an error is detected. The longer the test runs, the more likely that an intermittent error will be uncovered. This is especially useful if you think that your /// may have a loose chip that only shows up after the machine heats up. You can set it up to run when you would normally be done with the machine for awhile, check the status in the later. It was designed so that dealers could test problem machines over night or even over a weekend. At least one dealer used this test before putting used ///s on Applecare. The /// had to pass 12 hours on this disk to be approved.

To run the continuous test first make sure that there is a test disk in each of the external disk drives. Select the Continuous Tests option from the main menu, and press RETURN. The sound can be toggled off using N for no sound. If you have intermittent problems, it is suggested that the /// continuous test be run at least eight hours, overnight would be fine. If a fault is found, it will stop at the place of the test error with an appropriate message. If a fault is reported, retry the same test. If it detects the same problem, it is likely that you have isolated the problem. Most likely this a RAM error will be caused by dirt, corrosion, or loose chips. Try cleaning and re-seating the chips. If the problem continues, you should next try replacement chips.

Summary

There are several useful diagnostic tools for checking out the health of your ///. Either of the two diagnostic disks describe are useful and we would suggest that you purchase both as they will help pinpoint problems so that you may be able to avoid shipping your /// off for diagnosis and repairs. The ///s own internal self-test ability is important and it is by far the most important and most sensitive test of RAM chips. This test will highlight a chip as bad when it may still be functioning. In many instances Apple ///s have been know to run well for years with as many as eight or nine chips indicated as bad. What this usually means is that chips that are not making proper contact and may well be the source of intermittent problems.

Beginning /// (continued on page 21)

Draw ON /// — THE Graphics Tool for the Apple ///

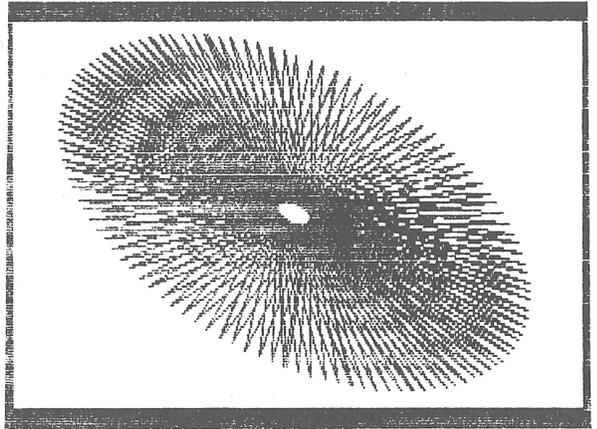

ON THREE is very proud to announce Draw On ///. Draw ON brings the power of LisaDraw and MacPaint to your Apple ///. Powerful cut and paste facilities let you create almost anything that you can visualize. Very fast, Draw ON lets you "pick up" objects on the screen and "Drag" them around in real-time. This is the most exciting package ever for the ///. With Draw ON you can become a one person graphic arts studio!

Since it works in any of the Apple ///'s color or B/W graphic modes and can quickly print out any picture you create, Draw ON is the first program to fully take advantage of the Apple ///'s tremendous graphic capabilities. Complex, pseudo three-dimensional figures are easy to create as you can place objects in front of or behind previously drawn objects. CAD is also possible with the powerful "rubber-banding" and grids available.

Ever been bored with some of the graphics that your business charting programs create? Would you like to add different titles? Change the "Look" of the graphs? Use different colors or even texture your graphs? It's all a snap with Draw ON ///!

Priced only at \$179.00, plus \$5.00 s/h, this is one of the few programs that you can't do without. All of the pictures in this ad were created with an Apple /// and Draw ON ///. It requires an Apple /// with 256K or an Apple /// plus.

Don't Miss Out

On This Offer!

ON THREE Presents... The Communications Manager

The Communications Manager is a powerful tool that allows your Apple /// to communicate or *talk* to other computers or services such as CompuServe™.

If you are familiar with other telecommunication programs such as Access /// or Terminus, you should be pleasantly surprised. VT-52 terminal emulation makes the program as powerful as any other Apple /// communications package. You can record incoming text to a printer or disk file for later viewing and transmit standard ASCII and Pascal Textfiles automatically. **The Communications Manager** has almost every feature of those popular programs plus an important extra.

This extra is error free transmission of files via the popular **XModem** and **Binary II** file transfer protocols. This means that you will be able to transfer programs and data - all types of files - between your Apple /// and virtually any other computer system.

The Communications Manager has all of the easy to use features of other ON THREE products, and it's the most powerful communications package available for your Apple ///. It's the *only* communications package available today for your Apple /// that completely supports the powerful **Xmodem** and **Binary II** protocols.

Included with this package is a version of **The Communications Manager** which runs as a stand-alone program and a version that can be installed as an accessory under **The Desktop Manager**.

If you have **The Desktop Manager**, you get the best of both worlds. You can be inside /// E-Z Pieces or VisiCalc and send a spreadsheet or data base file directly! The hundreds of Apple // AppleWorks templates available on bulletin board systems like CompuServe and others can now be yours! Thousands of pictures and other graphics images on CompuServe and other systems can be downloaded to your Apple /// with ease - with **The Communications Manager**. All this for *only* \$49.95 plus \$3 shipping and handling. Order your copy today!

Glossary of Terms

by Rutherford B. Thompson, Jr.

All the terminology you need

We all know that eight bits makes a dollar, but how many bits make a byte? What clock does not tell time? Every field of endeavor has its own language or jargon. The computer field is no different, even though the personal computer is being promoted as something everyone must have. Unless one is familiar with the language, he can easily become lost in trying to understand the instruction manuals. This article is designed to help the novice understand some of the more common terms he will find in the various computer publications and manuals, especially as they relate to the Apples - Apple III.

ASCII - American Standard Code for Information Interchange. This is a 7 bit (2~7) code representing the characters on the keyboard and the special characters which may be generated by pressing the control keys. Seven bits can give 128 characters since the **OPEN APPLE** key adds 128 to the numeric code of any keystroke. With the use of the **CLOSED APPLE** key some programs give additional meanings to the keys beyond the original 256 identities.

BASIC - Language used in programming a computer. Business BASIC is the name used by Apple III. To use this, the SOS interpreter file for BASIC must be loaded.

Binary numbers - Numbers consisting of only two digits, namely 0 and 1. Computers use this system internally, since they recognize only *off* (0) and *on* (1). Thus, the computer system is based on powers of 2. Humans usually use the decimal system, powers of 10, such as 10 fingers. The quantity 9 in the decimal system is 1001 binary. Compare with hexadecimal and octal.

Bit - The smallest amount of information handled by a computer. It is either zero or one (0 and 1) (off and on). Basically the computer responds only to on and off and the fundamental language written in binary numbers.

Block - A unit of information 512 (2~9) bytes long. The length of files and the size of disks is reported in units of blocks. A normal 5.25 inch diskette will have 273 blocks of memory available, the Back-up disks store 280 blocks, the ProFile stores 9728 blocks.

Block device - A device that uses one block (512 bytes) of information as its basic unit of communication. A disk is one such device.

Boot - Start up computer with an operating program. The boot disk must be in the #1 drive and door closed. Turn on the computer and booting automatic. If the computer is already on and operating, place a boot disk in drive #1, close the door and press simultaneously the **RESET** button and the **CONTROL** key. With ProFile and

Catalyst, the Catalyst boot disk is used and other operating programs can be directly accessed from the Catalyst menu without rebooting the computer. All boot disks must contain three files: **SOS.KERNEL**, **SOS.DRIVER** and **SOS.INTERP**. Most contain at least one other file—a program which is automatically run when the disk is booted.

Buffer - An area in the memory of the computer or other device, such as a printer that can temporarily hold information until the device can use it. This, in part, compensates for differences in operating speed of two devices.

Byte - A group of bits, usually 2^3 or 8 bits. Memory capacity is measured by the bytes of information which can be stored. Usually this is spoken of in terms of 2^10 or 1024 and abbreviated to K (normally K means 10^3 or 1000). Thus, four bytes is actually (2^2)*(2^10) = 4096 bytes; 128K = (2^7)*(2^10) = 131,072 bytes. The ProFile hard disk is rated at 4,980,736 bytes, 19*(2^18). Two bytes are required to designate an ASCII character. Two bytes are sufficient to designate 256 (2^8) characters.

Chip - Microprocessor unit (MPU). The heart of the CPU or mother board.

Clock - The circuitry that keeps various operations of the computer synchronized. It produces electrical pulses on the order of millions per second. Apple III specification is 2 MHz peak, 1.4 Mhz average. The abbreviation MHz stands for megahertz. Mega = 1 million. Hertz = cycle/second.

CLOSED APPLE - Located on the bottom row of the keyboard right of **OPEN APPLE** key. This key, like **CONTROL** and **OPEN APPLE**, modifies the meaning of other keys for special operations with some programs or operating procedures. When used, it is depressed then the other key is pressed, just as when using Shift. In some cases, the **CLOSED APPLE** key will increase the speed of repetition of the key. Better uses are now being made of the key in some programs such as the Desktop Manager and Draw ON III, both by **ON THREE**.

Configuration - Arrangement of software and hardware in a computer system. The configuration action of the SOS consists of the drivers (active) and their default parameters, determining how Apple III communicates with the console, the drives and the other devices. Configuration is performed using the SCP (System Configuration Program) in the System Utilities volume.

Console - Keyboard plus the video display.

TAU presents...
An evening with R.J. Lissner

That's right! You can enjoy listening to R.J. Lissner, the author of /// E-Z Pieces, at the **Phase III** conference in October. The conference, open to all Apple users, will be the highlight of the year. The **PHASE III CONFERENCE & EXPOSITION** is the first major gathering designed explicitly for the business and professional user of **Apple** Computers. The seminars have been planned to provide the business/professional user (and developer) with tools and skills to increase productivity and profitability. The headquarters hotel is the **HYATT REGENCY WOODFIELD** in **SCHAUMBURG, Ill.**, single or double occupancy. The hotel is about a 15 minute ride from Chicago's O'Hare Airport.

Conference Dates: Friday, October 2 through Sunday, October 4, 1987. **Conference fee - \$325; Companion fee (banquet, reception and exhibition only) - \$75**

To register, send your name, address, phone number, and business name and your position to: **PHASE III, INC., c/o Randall Jackson, 1511 N. Bell, Chicago, IL 60622.** Also use this address to request registration forms for hotel and exhibition information.

ON THREE presents

Crossword-Scrambler

Crossword-Scrambler is a computer program that is educational and makes learning fun. Unlike many software products, Crossword-Scrambler is a challenge and really makes you think. While it is not a "shoot 'em up" type of arcade game, you will not be disappointed by this game's graphic displays and musical interludes.

If you need a diversion from your daily computer routine, Crossword-Scrambler provides one without making you feel as if you're wasting time. Hundreds of different crossword questions provide hours of educational entertainment for you and your entire family.

Purchase Crossword-Scrambler today and start having fun with your computer.

Ranntings

by Richard and Lavona Rann

Are you an expert?

Practical expertise

Have you ever put much thought into the concept of expertise? It is an interesting concept and one that is applicable to us as /// owners. The term expert is one that is widely used and has both positive and negative connotations. The negative side is aptly described by a definition given at a 1940's Columbia University commencement by Nicholas Butler, "An expert is one who knows more and more about less and less."

A more positive definition is found in Webster's New World Dictionary, "a person who is very skillful or highly trained and informed in some special field". The difference between the definitions lies in the degree of specialization and the needs of the definer.

In terms of the ///, if we were writing a new compiler and needed to understand some detail from the internal workings of SOS, we would need someone who had specialized in the intricacies of SOS. They would have to know more about a more focused subject. On the other hand, if we wanted to know how to set up a custom printer in /// E-Z Pieces, the SOS expert might be no help at all. We would either need a /// E-Z Pieces expert, or a generalist that knew enough about a bunch of things to be what we will call a 'practical expert'.

We are fortunate to still have both kinds of experts in the /// community. No matter the negative comments applied to those who have really specialized. A master, wizard, or expert, by any name, is nearly priceless when you need one. There are still a few well known names that most of us would generally call Apple /// experts. We appreciate them, and recognize that we are fortunate that they are still around and helping us as a community. There aren't many of them. You certainly can't find them as simply as you could an expert on a MAC, or an IBM PC. The simple facts are that it takes time and money to accumulate and maintain expertise. Our dwindling community is not likely to generate many new experts to replace those that move on to more lucrative pursuits.

Now for the good news

The practical experts available to help each of us with our Apple ///s, number in the hundreds (or more). Better yet, they are very easy to find.

Where are they? Stop and think a minute. Let's look again at that definition of expert and see if we can isolate what it means in terms of what most of us need in the way of help concerning our ///s. First, look at our needs. We usually need someone that can help solve an individual problem

using a specific piece of software, or with moving data between different programs. The important point is that our needs are quite limited and generally relate to applications. In terms of these needs, the type of expertise we generally need is one of a certain level of skill or proficiency with using one program to meet practical needs. This is a practical expert; one who can make the program do the job rather than one who has to understand why or how the program works. These practical experts are the people that user their ///s on a regular basis.

You are probably a practical expert. Most that are, don't realize it.

Not long ago we were talking to a man who owned and operated a successful business in which he used an Apple /// to keep his records. In the course of the conversation the man described the decision process he used to select one software package over another. The process of selection covered some trial and error as he investigated and discarded several possible solutions along the way. In the end, his business was set up to run the way he believed best. He had discarded an accounting package to set up his own accounting system using a general data base program (/// E-Z Pieces) and file formats he created.

We were surprised by the man's efforts and success, but when we asked him to share some of his expertise with fellow /// users he was reluctant. "Oh, you can't mean that," he said. "I'm not an expert. I only did what I had to, nothing more." What he did was find a solution to his specific problem, but he failed to see the value of his accomplishments to others. He became an expert in the problems he faced. Unfortunately for others about to face the same problems, he sees Apple /// expertise in the narrow definition. He, and many of us, have been deceived by a myth that an expert should know everything.

In the past, there have been people that did know everything, or nearly everything, about a particular computer or a particular technology. That is becoming much less likely now that computers have become more sophisticated and the types of software available have become more varied. When it comes to the nebulous area of general problem solving, there are no experts in the finite sense. No one knows everything. Our acquaintance is as much an expert as anyone. He has built workable solutions that fulfill his criteria. Along the way he has learned enough about the workings of the Apple /// to be competent in its use. From our experience running the TAU Helpline, we can attest that his expertise would be of great value to many facing similar business problems.

We in the /// community need these sources of expertise

and we need to share our wide variety of practical expertise. Only a relatively small number of us have accepted the fact that we have our own areas of expertise. Even more important than that small number, is the fact that it is an even smaller minority of us that have taken active steps to share that expertise with others.

The essence of the problem is in the general cultural and social environment. The computer industry is built on expertise. Computer designers and engineers must develop a computer, then someone must write an operating system, and finally, application programs must be written. All these are done by people who have proven ability in their fields. Many of them are recognized as leaders. In our particular Apple /// family many of the leader/experts names are familiar. They are not only experts, but they are enthusiasts, too. They do things like publish magazines, write software, develop hardware, and run bulletin boards or user groups. They write articles explaining their interests, and here is where the difficulty starts. What is created is an unfair picture of who is an expert, and what constitutes expertise.

No one would argue that someone writing about a topic like SOS interrupts would probably qualify as an expert. Many of us seem to have forgotten, or never realized that not all areas of expertise are computer technical. What about the accounting solutions of our businessman acquaintance? Many people will face computing problems

such as keeping accounting records. The expertise of our businessman may be of more use to a wider audience than some of the very technical topics. It depends upon the needs of the audience.

It would be far too easy, and equally as unfair, to blame the publishers of computer magazines, and even the publishers of user group newsletters for not opening their doors to our practical experts. The reason they don't print more *practical* things is quite simple. They can only publish the manuscripts they receive. Our businessman would never have dreamed that he did anything that might be worth an article in a magazine.

Our goal in this month's column is to convince you that your areas of practical expertise are important, and to get you to share them. The kinds of problems that you have had to overcome and solve are inherently interesting to others that face the same problems. Don't fall into the trap of thinking: "If I can do it, then anyone can; so it can't be much." That trap is based on a falsehood, and is a form of humility that is essentially harmful to yourself as well as to the whole /// community. There is no monopoly on solutions. The business person, hobbyist, technician and casual user all have solutions, and the level of technical expertise may not be the deciding factor when measuring the practicality of the solutions. Spreading information and a variety of solutions is important to us all.

This Desktop Manager module lists the decimal, hexadecimal and corresponding character values of all ASCII keyboard characters. A second screen shows the decimal and hexadecimal equivalents of keypresses which include the control key. This keypress table can be invaluable when you need to know printer commands to enable different printer modes. The ASCII table is a necessary tool for programmers of all skill levels. Why not have them both at your fingertips? Only \$9.95 plus \$3 s/h.

256K RAM Upgrade

by Edward N. Gooding, Sr.

Time to beef up your RAM?

This article describes the procedure for upgrading an Apple /// from a 12 volt-128K RAM system to a five volt-256K RAM system. This upgrade involves an exchange of the Memory Board, the removal of a resistor, the creation of a solder bridge, and the exchange of two PROM chips. These instructions must be followed **exactly** or a malfunction can result.

This upgrade is only to be performed on 128K RAM systems with Memory Board having part number 610-4128, and Main Logic Boards (MLB's or motherboards) of post-14,000 serial number systems, identified by a white dot near the I/O slots (location I1).

Tools and parts needed

- A slotted screwdriver to remove the ///s Peripheral Access Cover.
- A #2 Phillips screwdriver to remove the MLB's Access Cover.
- An IC (integrated circuit) puller or small, narrow slotted screw driver.
- A 25 watt soldering pencil.
- A small amount of 60/40 rosin core solder.
- A damp sponge to wipe the soldering pencil on to clean it.
- Thin copper wire, preferably 22-28 gauge thickness.
- A knife or crimping tool to remove insulation from the 22-28 gauge wire.
- Diagonal cutters, or other small wire cutters.
- Needle nose pliers to hold the wire during soldering.
- A 5 volt, 256K Memory Board.
- PROM IC part number 342-0061.
- PROM IC part number 342-0063.

Note: Both PROM's and Memory Boards are sold by *ON THREE* for \$150.

Removal of the Main Logic Board and Memory Board

To remove the Main Logic Board and Memory Board, follow the following directions to the letter.

First of all, power down the Apple ///. Then, disconnect the AC power cord from the source and then from the power receptacle at the back of the ///. Also, disconnect all external cables from the back of the ///.

Remove the Peripheral Access Cover, and then remove all interface cards in slots 1-4. The cover is removed by turning the two capture screws 1/4 turn only. They will not fall out, but are retained in the ///s cabinet. The two screws are located under the Peripheral Access Cover, at the two corners nearest the keyboard.

Replace the access cover on the /// after removing any inter-face cards. It is not necessary to tighten the screws at this time. Place the Apple upside down on a soft pad. The rear of the Apple should face you.

Locate the 10 Phillips screws around the edge of the Main Logic Board access panel. Depending upon the type of bottom pan, there may be one or two additional recessed screws located in the rear of the bottom pan. The Main Logic Board access panel will be the larger of the two panels on the bottom of your ///. The smaller, rectangular shaped access panel allows you to remove and replace your ///s power supply. You do *not* need to touch that for this procedure.

Remove the 10-12 Phillips screws that secure the larger access panel. **Caution:** The Main Logic Board is attached to the panel, and is still connected electrically to the keyboard, internal disk drive, speaker, and the power supply. Cable length allows the access panel to be tilted from the chassis about 45 degrees only, until you disconnect them.

Slowly tilt the access panel up from the side closest to the power supply. Allow the opposite side of the panel to remain resting on its edge in the small groove around the access panel.

While supporting the Main Logic Board with one hand, disconnect the power supply cable from it. This is best done by grasping the connector and rocking it back and forth from side to side as you pull on it. Note that it is designed in such a way as to prevent you from connecting it backwards when you reassemble your ///.

Now let the power supply side of the Logic Board down, and lift the side of the Main Logic Board that is furthest from the power supply. You will note two ribbon cables that connect the keyboard and the internal disk drive to the Main Logic Board. You will also note a double-stranded wire with a white Molex connector that connects the internal speaker to the Main Logic Board. You should remove all three of these connectors. Be sure to note which ribbon cable goes where, since they both look alike. Note also that the ribbon cable connectors have a tab on one side that will prevent you from inserting them back incorrectly when you re-assemble your ///. It does not matter how you orient the speaker connector when you re-install it.

If you have installed the video interlace kit, and/or the clock battery backup kit, you will also have to disconnect these cables in order to fully remove the

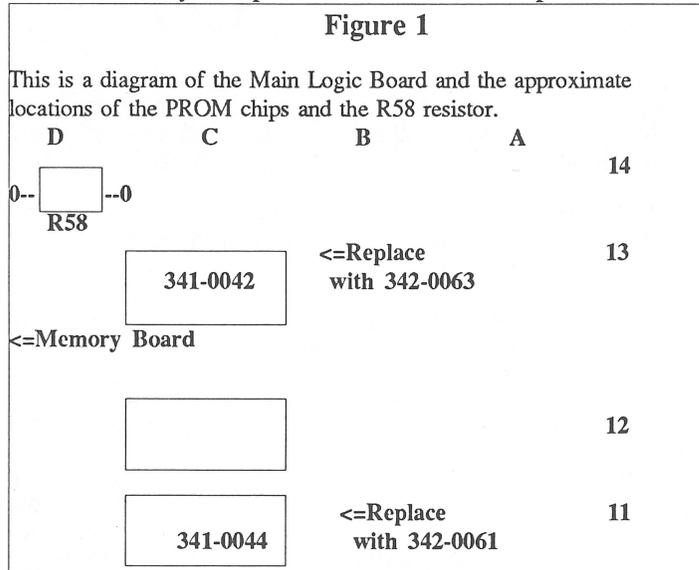

Main Logic Board from your ///.

The Main Logic Board can now be fully removed from your ///. You should place it on a flat work surface to continue this procedure.

Using both hands, remove the existing Memory Board from the Main Logic Board. You will note that the Memory Board is piggy-backed to the MLB. They are generally mounted very tightly, and unless you are lucky, you will have to apply a lot of *careful* force to fully remove the Memory Board. Work with one end of the Memory Board at a time, rather than trying to remove it evenly at all four corners. I generally grasp one corner of the Memory Board with my right hand (since I'm right-handed) and place my left hand on the MLB to support it, and pull straight up on the corner. A slight rocking motion will sometimes facilitate the removal process. After I get the one corner up, I will work on the other corner from the same end of the board. When I get that, I move to the other end of the Memory Board and then remove the two remaining corners and lift the Memory Board away from the MLB. If you should happen to bend some of the pins on the MLB, don't panic, you can usually just straighten them back out with no problems. If you break one, you are in trouble.

PROM replacement

On the MLB, locate the IC that is located at coordinate C13. The coordinates are displayed as white letters on one side of the MLB, and as white numbers on the perpendicular side of the MLB, and are used like X,Y coordinates on a graph. The IC (integrated circuit) at C13 is identified by the part number 341-0041 printed on the

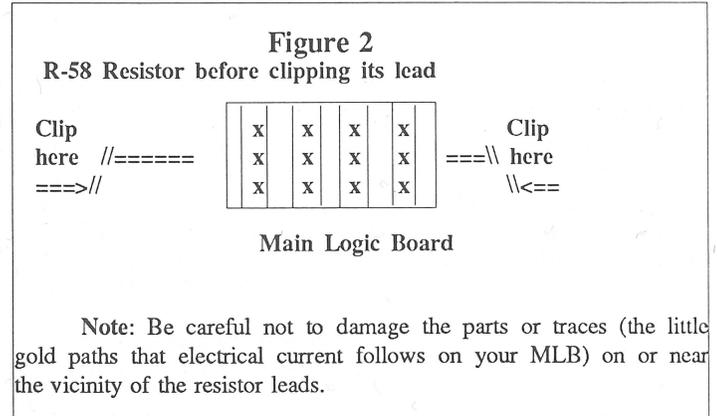

MLB, and on the PROM chip, also.

Remove this PROM chip with the use of an IC puller tool (looks like large tweezers with hooks on the ends, and can be purchased at any Radio Shack or electronics store). You can also use a small, slotted screwdriver and *carefully* insert it between the chip and its socket at one of the two narrow ends of the rectangular chip. Carefully pry the chip up with the screwdriver until you can grasp it with your hand and remove it. Replace this IC with PROM IC part number 342-0063. Be sure to install the PROM in the

same direction as the one you removed. You can double check this by ensuring that the writing on the chip is oriented in the same direction as the writing on all the other chips on the MLB.

Also locate the IC at MLB coordinate C11 (identified by part number 341-0044 on the MLB and on the PROM

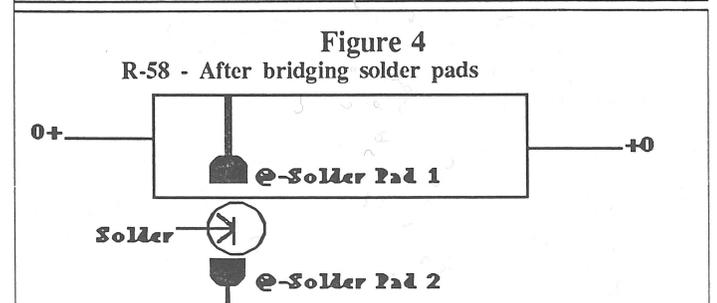

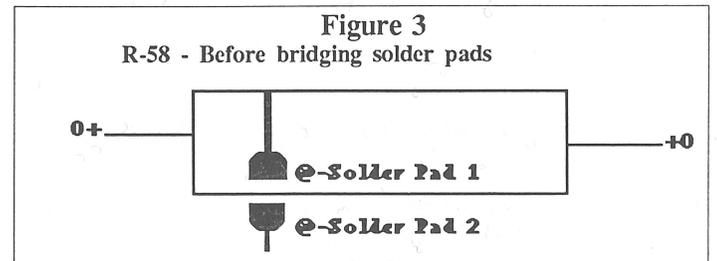

itself). Replace this IC with PROM IC part number 342-0061.

Resistor removal and solder jump

Locate the resistor R58 at coordinate D14. It will look like a skinny tube about 1/2" long, with colored bands around it and will be connected to the MLB by wire connectors at each end of the resistor.

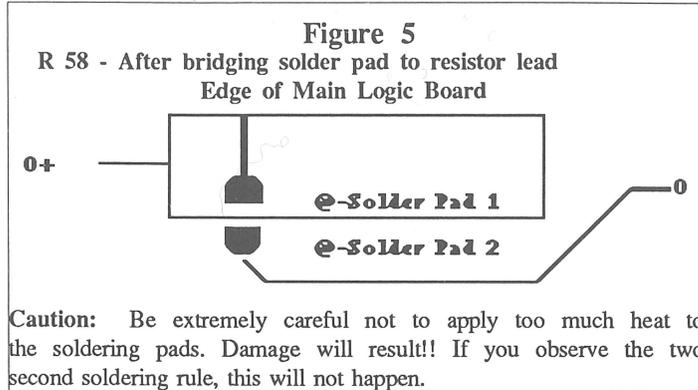

With a pair of diagonal cutters, remove this resistor by cutting the wire leads at each end of it. Refer to the diagram in Figure 2.

Observe the two tiny, triangular or quarter-moon shaped solder pads that were exposed when you removed the resistor. They should lie under, and perpendicular to the R58 resistor. You will note that there is a blank space between these two pads where you can see the fiberglass

portion of the MLB. You need to "bridge" these two solder pads so that electrical current can flow between them. Refer to the two top-view diagrams in Figure 3 and Figure 4, respectively:

First, melt a small drop of solder on both of the solder pads, then take a 1/2" length of very thin electrical hookup wire (22-28 gauge) and "tin" it (coat the wire) with the solder. Also make sure to tin the soldering iron that you will use by applying solder to the pencil and allowing the solder to flow freely around its tip. Wipe any excess solder off with the damp sponge. When properly tinned, the soldering pencil should exhibit a shiny, silvery appearance on its business end. If it does not, repeat this process until it does. Tinning allows the easy transfer of heat to the

parts to be soldered. As you work, periodically wipe the tip of your soldering pencil on the damp sponge to wipe off any dirt or oxidized solder. Also be sure to re-tin the pencil periodically.

Note: Be sure to use a low-wattage soldering pencil, not a solder gun. You can buy a solder pencil from Radio Shack for about \$6. Never hold the tip of the solder pencil to the MLB, or any electronic component for more than two seconds, as more than that will damage the circuit or worse, pull the gold electrical traces off of the MLB.

Hold the wire down across the two solder pads with a pair of needle nose pliers, and with a sweeping motion run the soldering pencil along the length of wire from one solder pad to the other. Use your diagonal cutters to clip the excess wire away. A good solder connection will be evidenced by a shiny appearance, as well as by an electrically and mechanically sound connection. If you have a multi-tester or continuity tester, you can test the connection before you go any further.

Note: If you don't feel comfortable about bridging the two pads together because of the limited amount of working space, you can use a 1 to 1-1/2" inch length of 22-28 gauge electrical hookup wire. Solder one end of the wire to the small piece of wire that remains on the MLB from where you clipped the *left* end (oriented with the edge of the MLB closest to you) of the resistor.

Solder the other end of the hookup wire to the solder pad *furthest* from your position. This will work just as well. I would also recommend that you leave the insulation on this wire, except for 1/8" at each end that should be stripped for soldering. Refer to Figure 5 to see a diagram

of this connection.

Memory Board replacement

Note that the Memory Board has notches at two of its corners. *It is very important to make sure that the side of the Memory Board with these notches is closest to the four peripheral slots.*

Align the connectors of the replacement 256K RAM Memory Board over the pin connectors of the MLB. The best way to do this is to tilt the Memory Board and align the pins on each side and lower the raised edge slowly, starting the next pins on each side as it is lowered.

Check that all the male pins are started correctly into the female connector of the Memory Board. If any of the male pins are not properly started, lift up the Memory Board slightly and move it back and forth until the pins are correctly aligned.

Once the pins of the connectors are all aligned, gently but firmly push straight down on the connectors on both sides of the Memory Board until the connectors are fully bottomed out.

Main Logic Board replacement

To reinstall or replace the logic assembly, reverse the procedure as outlined in the first 10 paragraphs under the subheading, "Removal of the Main Logic Board and Memory Board," as mentioned above in this article.

Make sure that all cables are reinstalled correctly and are not crimped or punctured by mounting hardware.

Testing

Use the Apple /// Confidence diskette for performing diagnostic tests of the 256K RAM upgrade. I would recommend selecting continuous testing, and let it run for a least 30 minutes without interruption. This will allow your ///, and the new RAM chips to fully warm up. I usually set mine up before I go to bed, and let it run all night. If my /// is still chugging away when I wake up, then I can be pretty assured that I have successfully upgraded my /// to a 256K system that will run cooler and therefore more reliably due to the lower power drain of the five volt Main Logic Board and Memory Board. It makes me cry to remember how I paid my Apple dealer \$800 to do this to my first !!!! Now you can do it yourself for about one fourth of that cost. 

Beginning /// (continued from page 11)

With this article and our prior one on cleaning and re-seating chips, you now know what tools are needed, and have knowledge to find and repair the most common difficulties with your Apple ///. Over the past years, the /// has proven very reliable, and yet it has remains susceptible to a few common difficulties. Most problems are manageable without the aid of a costly repair service. This month's material will help determine when your /// needs the help of an expert. Setting disk drive speed is one more topic under the heading of general maintenance. It will be covered in a future column. 

NEW LOW PRICE!

Graphics Manager

\$39.95 plus \$3 s/h

If you've been holding out for a lower price on the Graphics Manager for the ///, here it is! Take advantage now. The complete graphics utility for the Apple /// interfaces to **Draw ON ///**TM and all graphic programs and allows printing enlarged or reduced portions of the graphics screen, normal or inverted, single or double density with four rotation values.

For the first time you can load directly any DOS 3.3 or ProDos Hires or double Hires graphic files (including "Print Shop") and of course SOS fotofiles or other binary graphic images.

Comes complete with full documentation and diskette containing standalone SOS interpreter and **ON THREE's** Desktop Manager module. All popular printers, serial and parallel interfaces supported and limited color graphics capability is included.

ON THREE asks you to answer the following questions.

	Yes	No
Are you tired of swapping floppies?	<input type="checkbox"/>	<input type="checkbox"/>
Do you wish to compute more efficiently?	<input type="checkbox"/>	<input type="checkbox"/>
Do you ever receive "Out of room on volume" messages?	<input type="checkbox"/>	<input type="checkbox"/>

If you answered YES to any of these questions, then you need a hard disk. A mass storage device capable of holding **INCREDIBLE** amounts of data for your retrieval at a couple of keystrokes. And if you need a hard disk, then you need the best. Try a Xebec Sider 10 Megabyte or Sider][20 Megabyte hard disk from **First Class Peripherals** and *ON THREE*.

The same dependable disk used by the Apple][can now be used by the Apple ///. You won't believe the speed and efficiency.

Sider hard disks-----Access time = 85 msec

Profile hard disks-----Access time = 180 msec

NOW look at the price:

Sider (10 Megabytes) = \$800.00*

Sider][(20 Megabytes) = \$950.00*

*plus \$35.00 s/h

And if you combine it with **Selector ///**, the disk switching utility, you have an incredibly fast, hassle-free system. So, if you want the speed, accuracy and dependability of a good hard disk at a great price, come to *ON THREE* for your Sider and Sider][hard disks!

Recipe for a Menu

by Charles G. Barton II

Tasting a homemade menu

The purpose of this article is to present a method for making a self-booting diskette which will present a two-screen menu. Each screen will present five options to the program's user.

The first menu, called the Main Menu, will permit you to perform two utility functions using programs supplied on your Apple Business BASIC disk, as well as catalog any drives on your system. Another option will run the second page of the menu. The final option available on the Main Menu is labeled "Stop", and permits the user to exit the Main Menu altogether to a blank BASIC screen.

The second page of the program will allow you to select and run four of your own BASIC programs. The fifth option on the Second Menu will return you to the Main Menu.

Getting ready

To start, you need a blank, formatted diskette which will be called "Menu Disk" from this point forward and the Apple Business BASIC diskette which came with your Apple /// when purchased.

The first step is to boot your Systems Utilities program. Using the *File Handling Commands*, copy the following eight files from the Apple Business BASIC diskette to Menu Disk:

- | | |
|----------------|----------------|
| 1. HELLO | 5. VOLUMES.INV |
| 2. TIMESET | 6. SOS.DRIVER |
| 3. VOLUMES | 7. SOS.INTERP |
| 4. TIMESET.INV | 8. SOS.KERNEL |

Still using the File Handling Commands, *unlock* "HELLO", "TIMESET", and "VOLUMES" on Menu Disk. (If you need to reconfigure the SOS.DRIVER on your Menu Disk, unlock that file as well and make the necessary changes with the System Configuration Program (*Relock* the SOS.DRIVER on Menu Disk before exiting the Systems Utilities program.)

From this point forward, you will be using only the Menu Disk which should now be placed in the primary disk drive (.D1).

Changing the "HELLO" program

Boot your new Menu Disk. *Load* the "HELLO" program and *delete* all program lines. (See the Apple Business BASIC manual, volume 1, page 12 for deleting program lines. Page 19 gives instructions for load and save commands.) Enter the following program lines in their place:

```
10 HOME
20 RUN "MAIN.MENU"
```

Now save the above program as "HELLO" on the Menu Disk. I also suggest *locking* the "HELLO" program by typing LOCK HELLO - that way you can't inadvertently alter or delete the program.

Altering the Business BASIC programs

Earlier you copied and *unlocked* program files named "TIMESET" and "VOLUMES" from the Apple Business BASIC disk to your Menu Disk. In this step, you are going to change both programs, so that after they have done what you want, either program will return you to the Main Menu.

Load the "TIMESET" program and add the following lines to the program:

```
200 IF KBD=27 OR KBD=13 GOTO 4000
4000 TEXT:HOME:CLEAR
4010 RUN "MAIN.MENU"
```

Save and *lock* the "TIMESET" program. *Load* the "VOLUMES" program and add these program lines:

```
5 HOME
300 PRINT:PRINT:PRINT
310 IMAGE 80C
320 PRINT USING 310;"*** PRESS ANY KEY TO RETURN
    TO MENU ***"
350 GET PRESS$
370 IF PRESS$<>" " THEN CLEAR:RUN
    "MAIN.MENU"
```

Save and *lock* the "VOLUMES" program.

Main Menu program

The Menu Program controls the selection of the options available on the Main Menu as well as the screen format on which the Menu is displayed. The MAIN.MENU program (rather than a separate program) also controls the *catalog* option on the Main Menu.

Enter the program shown on Page 25. *Save* and *lock* it as "MAIN.MENU" when you are finished.

The ON ERR (lines 820 and 920) are included as part of the catalog option so that your program will not break down in the event that: a) no disk is in the specified drive; b) the drive's door is open; or c) no drive exists for the number or pathname entered by the user. The OFF ERR

commands found in lines 880, 985 and 1020 and switch the ON ERR command off before returning to the Menu.

Line 530 is an error trap and will continue to present the user with the Main Menu until a number from 1 to 5 is input.

Lines 420-460 on the "MAIN.MENU" program are a loop, although the lines do not resemble the more common FOR and NEXT loop statements as described on page 111 of the Apple Business BASIC manual. I chose the less familiar method because it illustrates the use of READ and DATA statements within a program.

In my program, each DATA statement on lines 115-140 is READ by line 430, assigned the variable name OPTION\$, and printed to the screen by line 450. The loop (line 430 to line 440 to line 450 to line 460, and back to line 430) continues until line 440 finds that OPTION\$ = "END OF DATA" as established by the DATA statement on line 140. At that point, because the statement on line 440 is now true (that is, that OPTION\$ does indeed equal "END OF DATA"), the program exits the loop and continues running on line 470, just as instructed.

Data statements (in this case, lines 115-140) can appear anywhere in your program without adverse consequences and are *read* in the order that you list them. Each DATA statement is read only once. If you try to read any data statement a second time, the program will stop with an error message unless you incorporate countermeasures: after all data elements have been read the first time, inserting a *clear* (line 90) or *restore* (line 470) command will allow the statements to read again, in this case starting with the first data statement on line 115.

The *restore* on line 470 isn't strictly necessary because the program's execution is always redirected to line 90 which contains a *clear* command. However, in a different program that may not be the case and line 470 presents one method for dealing with the problem.

The IMAGE 80C statement on line 95 is used to center printed output on a standard 80 column screen (or standard 8 1/2" paper, if the output is directed to the ".PRINTER").

The IMAGE 80X statement on line 100 prints 80 spaces which, when *inversed* and invoked with the *print using* command (as on lines 345 and 360), form a solid light-on-dark bar across the screen, thereby forming part of the menu's border. Blank spaces, usually dark on the screen, are returned to that state by the command *normal*.

The GET command (line 990) will accept any key typed at the console, and will return the user to the Main Menu. The difference between a GET command and an INPUT statement is that GET does not require the user to press the RETURN key after touching any key on the keyboard.

The VAL function on line 540 creates a numeric variable named RESPONSE from the string RESPONSE\$. On line 250, the program is directed by the ON RESPONSE GOTO... statement to branch to lines 620, 630, 640, 650 or 670, depending on whether the value of RESPONSE is 1, 2, 3, 4, or 5 respectively.

The VPOS/HPOS commands found throughout the program are a precise means of positioning the cursor on the screen.

The second menu

As noted at the beginning of this article, this program offers a first page menu of utility options, and a second menu screen which will allow you to run any of your own BASIC programs.

The second program shown is needed for the second screen. Although you could type it in line for line, there is a faster way: *load* (but don't *unlock*) "MAIN.MENU" and edit it as follows:

Alter the DATA lines 115-130 to reflect the name of each of your BASIC programs (Don't forget prefixes or pathnames). Do the same with lines 620, 630, 640, and 650. Be sure to enclose the names of your BASIC programs in quotation marks.

Change line 135 to read: 135 DATA "5. RETURN TO MAIN MENU"

Change line 250 to read: 250 ON RESPONSE GOTO 620,630,640,650,660:REM VARIABLES USED IN

Change line 660 to read: 660 HOME:RUN"MAIN.MENU"

Alter lines 620, 630, 640, and 650 by entering the file (and path, if necessary) names of each of your programs in place of the names "TIMESET", "SECOND.MENU", etc.

Delete the following lines: 280, 670-1120, 1230-1235, and 1250-1265.

Change line 150 to read: MENU\$="SECOND MENU". Do the same with line 1240.

On line 110, change SPACE25\$ to SPACE27\$ and add two blank spaces between the quotation marks. The line should now read: SPACE27\$=" ":REM 27 BLANK SPACES.

Change the variable name SPACE25\$ to SPACE27\$ on lines 320, 340, and 1300.

Change the HPOS value on lines 325, 330, and 335 to HPOS=53.

Finally, *save* the changed program with the name "SECOND.MENU" and as before, LOCK it to save yourself from inadvertent deletion of the program.

In closing, this article was written for those individuals just getting started in BASIC programming, and contains information I learned the hard (and slow) way. Like most recipes, it will be fine to use it as is, but will be even better if it is personalized by your creativity.

For instance, you can design your own menu borders, enter additional error traps, and have the output from the catalog function directed to either the screen or a printer, as desired by the user.

Or, instead of running programs directly with the

"SECOND.MENU", you can have it run other menus, which in turn can lead to further menus and programs. So by all means, experiment with the *ingredients*..

ON THREE presents... The Uncopyprotect Driver \$19.95 plus \$2 s/h

ON THREE has not changed its position regarding duplicating copyrighted programs for profit or to give away, but since many Apple /// software products are no longer supported, owners of AppleWriter ///, VisiCalc, and VisiCalc Advanced Version are facing the problem of what to do when a diskette "crashes." After much consideration we decided to proceed with a product to solve that problem. *The Uncopyprotect Driver* will allow you to make back up floppies of the above programs. For the first time, you can put your master disk in a safe place and boot on the duplicate.

Economically priced at only \$19.95 plus \$2.00 shipping and handling, the *Uncopyprotect Driver* comes with full documentation and will work with *Selector* /// so you will no longer require a "key" diskette. *The Uncopyprotect Driver* is sold for legitimate *Archival* purposes only. *ON THREE does not condone* and will not condone duplicating a disk for any other purpose.

```

The Graphics Manager™

NOW AVAILABLE FOR THE //c AND //e!

- The Graphics Manager is a new and exciting utility for your Apple //e or //c. Print black/white hi-res, double hi-res, full 16 color double hi-res and Print Shop™ graphic images in an infinite number of sizes and positions. Copy any number of images onto the same page. Point and click graphics interface makes it easy!
- For the first time you can print your graphics the way you want them. Sophisticated image analysis lets you take your entire picture, or a portion of it, expand to fill a page or shrink it down to a small section. Rotate, invert or flip the image to suit your needs.
- There are plenty of programs for creating graphics, but until the Graphics Manager you had to settle for 2nd-rate print outs. Order the Graphics Manager today and start enjoying print outs that are better than the originals. **Not copy-protected!**
- If your printer or interface card isn't listed below, don't despair - call us. Help us make the Graphics Manager work on a new printer and your copy is free! Requires 128K //e or //c, mouse or joystick. Lightning fast because it's 100% assembly language.

Works with these popular printers and interface cards

Black/White Printers

- Apple Dot Matrix
- Epson MX, FX, RX
- OkiData 84/92/93
- Star (Gemini)
- ImageWriter
- ProWriter
- HP ThinkJet
- Fujitsu DPL-24

Color Printers

- Apple ImageWriter II
- Scribe (Epson)
- IDS Color Prism
- Epson JX-80

Interface Cards

One, Two, /// Forum

Suggestion box

You once asked readers what they'd like to see in *ON THREE*. Here's what kind of an Apple /// user I am, and what I'd like to see:

I have a 128K machine, which I bought new when the Apple /// first came on the market. I have two disk drives, and two Cursor ///s (paddles) that work just fine. I have a cheap monochrome CRT.

I assumed that the Apple /// would occupy the place in the market that the IBM PC does now, and that I could look forward to decades of buying and creating software and hardware. I, like everyone else, was sadly mistaken. Now I want to buy a new computer; I like the MacIntosh II, but do I dare risk another \$6,000 in the Apple Company? Several experts have already warned me against the Apple IIGS, saying that it's another dead end. I have used my father's IBM XT extensively, and I didn't like it as much as my ///.

I still have the VisiCalc and AppleWriter /// that I bought with my machine. I wish I could buy Pascal. I also wish I could buy the advanced version of Applewriter /// I heard about that has a 'macro' function. If *ON THREE* offered this software at a reasonable price (like around \$50.00) I'd buy it gladly.

I will have be forced to buy a new machine because I need the things the Apple /// can't do, like talk through a modem, hold a megabyte of RAM, and have access to a lot of software and peripherals, including games and recreation.

Whenever I read the IBM magazines I drool over the fantastic array of hardware and software available for PCs. But when I actually contemplate trying to work with that eye-busting screen display, that slow and unfriendly operating system, and the crippled IBM environment in general, I just can't force myself to take the plunge. My old Apple /// is a better machine than the brand-new IBM XT I wrote the last chapter of my novel on!

Speaking of that, readers might be interested to know that I recently completed a 375-page novel using the AppleWriter /// on my 128K machine. I couldn't have asked for a better word processor... except for the size of the memory. The novel is called CHARON'S ARK, and it will appear on the stands in August. It's a paperback science-fiction adventure, published by Del Rey. I have signed a contract for the novel's sequel, and am already a chapter deep into it.

What kind of articles would I like to see in *ON THREE*? I

want BASIC programs, because that's all I can use. I would like animation and perspective graphics programs in BASIC. I want Pascal and some kind of way of getting into the guts of the machine (like PEEK and POKE). I would like drivers, and/or instruction on how to write drivers. I would like a graphics pad, or instructions on how to modify the Koala Pad plug to fit into a paddle port (if possible).

In the fairy godmother department, I wish someone would tell me how to make my machine use some command other than INPUT# to read the buffer of my Hayes Micromodem IIe. If whoever I'm on the phone with doesn't happen to send a carriage return character, INPUT# causes the program to just sit, waiting for the carriage return that isn't there. It can't see if the buffer is empty, it can't ask the other guy to send a carriage return, nothing. All I can do is reboot. In effect, I can't do anything with this modem. I could buy another modem and some software (assuming I can find such a thing) for \$200 to \$300. Do you have any suggestions?

Even if I have ranted and raved in this letter, I want you and your staff to know that I have an extremely high regard for the work you do. All of us poor Apple /// owners should get down on our knees every night and thank God for *ON THREE* magazine. May you live long and prosper.

Rick Gauger,
Bellingham, Wash.

As you mentioned, you are not the only one who was "sadly mistaken" when purchasing your Apple /// but most of the the /// users who still enjoy their machine, have learned to work around problems encountered.

You may think that the /// is dead, but just like a new car is maintained, we must maintain our ///'s even if that includes buying new, improved parts. If you really enjoy your /// and do not wish to bury it because of the satisfaction you get when using it, then upgrade it and get the most out of it. If you wish to consider purchasing another computer, like the Macintosh II or the Apple IIGS, then go for it. I don't know who your informants were who said that the IIGS is a dying breed as the GS is one of the most popular computers around today and the market is expanding. For your use of the computer, I don't believe you can find a cheaper and better setup than the ///. For instance, /// E-Z Pieces is available for \$135 while Apple II users must use AppleWorks, which costs \$250.

Concerning software programs for the ///, you can buy Pascal for \$99 plus \$5 s/h from ON THREE. AppleWriter 2.0 is available through Sun Systems

Remarketing, P.O. Box 4059, Logan, Utah 84321 for \$50 plus \$3.90 s/h. You may want to consider joining TAU users group for \$25 a year. The group has a large public domain, upgrade and royalty ware library. To join TAU write TAU, c/o Lavona Rann, 1113 Wheaton Oaks Drive, Wheaton, IL 60187.

I don't know how often you read ON THREE from cover to cover, but I believe that you may have missed a few key articles that would put your mind at ease about modems in the III world. Please read III Telecommunications in April's issue. You may note that a nice modem can be picked up for around \$100. To add to that, communications packages are available for under \$100. In fact, ON THREE's Communications Manager™ is available for \$49.95 plus \$2 s/h. So that's about \$150. In this month's issue, you can find out more about the communications market by reading Apple.Sauce. For more games, author Ed Gooding has devised a way for you to enjoy some][games on your III which will be published in the near future. Also, you may want to note that you can buy a 512K upgrade from ON THREE for as low as \$289.

In reference to your concern about your MicroModem, I talked to our programmer, Tim Harrington, about it. He wants to know how you are using the MicroModem IIe card in your III. As far as Tim knows, one will not even fit into the slots. He says that there is an easy way to get characters from a modem using BASIC. Use the GET#1 command instead of the INPUT#. When you issue the GET#1 to the RS232 driver, it will sit there and wait for a key from the modem. If you don't like that, you can set up a no-wait mode and it will avoid this situation. The best

way to do this is via an invokable. Apple supplied a few invokables on the BASIC system disk that will do all you need. There are quite a few modems that will work perfectly with the III and there are about 10 terminal programs that will allow you to use the program.

You also mentioned on your wish list that you would like to see a new graphics pad, drivers and more BASIC programs. Tim says that they are on their way. As for BASIC programs, we will try to publish as many as possible in ON THREE.

We do need to know what the consumer would like to see from time to time and we appreciate your ideas and plan to put most of them to use. Also, thank you for the nice comments about ON THREE magazine. We appreciate your comments and concerns for the magazine and company. If anyone else has comments, we are open to suggestions.

Commando Print

A few weeks ago, I purchased your 512K memory upgrade and it is working up to its standard beautifully. My question is regarding the fact that the print commands that you supplied are those for the Epson line of printers. I have an Apple ImageWriter I, and am having problems invoking various printer commands when I want to use them. Yes, I have upgraded my AppleWriter III disk to the new version which was supplied with the 512K memory board. Particularly, I am interested in subscripts and superscripts. Although the others would be nice, too. Would you please send me a list of these commands for the Apple

ON THREE presents...

Disk Manager

Disk Manager

File Commands

List Directory
Copy File
Delete File
Rename File
Lock/Unlock

Device Commands

List All Devices
Copy Volume
Format Disk
Rename Volume
Verify Volume

⌘? = Help

Use Arrow keys to SELECT, Press RETURN to RUN. ESCAPE to EXIT.

This Desktop Manager module features the most frequently used applications of Apple's System Utilities and makes them available to you from within any program. Copy, delete, rename, lock/unlock and list all of the files on your disk without leaving the program you're using. Copy, format, rename and verify *volume* commands are available as well, so you will never again lose data because you exited a program to format a disk. Only \$44.95 plus \$3 s/h.

ImageWriter I.

Robert Kacer,
Downers Grove, Ill.

Thank you for the comments on the upgrade board. We will gladly send you the list of commands but also feel that it is necessary to share the information with others.

The file that holds the printer codes for direct Open Apple access is called "GLOS". This just holds the codes so that you can get to them by simply pressing OPEN-APPLE-SHIFT and the corresponding letter. To release these codes you just press OPEN-APPLE and the corresponding letter. This is just a glossary. These can be constructed easily and the procedure is right in the AppleWriter III manual.

To use the present glossary, all you have to do is to load it, as an ASCII file, into AppleWriter. To put the ImageWriter codes in there, all that you have to do is to replace the new letters or numbers in the proper places. An example would be:
b V [F V (The V being CONTROL-V)

All that you would have to do is to enter the sign for boldface end in place of the F (for ImageWriter the sign is a" (quotes)). There may be an ESCAPE character (I) in there. Ensure that it is there if it is required. The codes for the ImageWriter can be found on page 81 of your printer manual and for the Apple Dot Matrix printer on page 80 of your owner's manual.

You also can add to the glossary by inserting control codes for the things that your printer can do. Remember, for most codes, there is a release that must be used to return the printer to normal operation. After you have altered the glossary to your liking, save it back as either "GLOS" or a name of your own making. To call it you just have to press, CONTROL-Q E, and type in the name and it will be invoked. You can read more about this glossary by printing out the file "GLOS.NOTES". This will give a much more detailed view of the glossary.

Pascal system library

I have enclosed a list of instructions for making a Pascal system library to run Fortran 1.0 programs. I also want you to know that I am very pleased with Selector III, Pascal update, 512K Memory Upgrade and Fortran 1.0. I appreciate you supporting my Apple III.

Roger D. Weiss,
Caseyville, Ill.

Thank you for the fine comments about ON THREE. We are happy to support your III and are glad that you enjoy our products. Thank you for sharing the Pascal system library instructions with other readers. Without further delay, here is your listing.

First format two disks with System Utilities.
Place Pascal0 into .d1 and press CONTROL-RESET.
At the prompt, place Pascal1 into .d1 and press RETURN.
Place Pascal 3 into .d2 and press X.

At prompt, "execute what file?," type .d2/library press RETURN.

At prompt, "output file->", type .d1/plib press RETURN.

Place formatted disk into .d1

At prompt "input file->", type .d2/system.library press RETURN.

At copy prompt line, type = press RETURN.

Now the Pascal system library is stored on .d1/plib

Place Pascal1 into .d1 and type Q, you are now back on Pascal command line.

Type X, .d2/ library.code is already on prompt line so press RETURN.

At prompt line "output file->", type .d1/flib press RETURN.

Place second formatted disk into .d1

At prompt "input file->", type .d2/system.library press RETURN.

At copy prompt line, type =.

After this library is copied, type N for new file.

Place Fortran.1.0 in .d2

At prompt "input file->", type .d2/system.library press RETURN.

At copy prompt line, type 13, press RETURN.

At prompt "slot to copy into?" type 13, press RETURN.

At prompt "slot 13 already linked reconfirm (Y/N)", type Y.

At copy prompt line, type 14, press RETURN.

At prompt "slot to copy into" type 14, press RETURN.

At copy prompt line, type 15, press RETURN.

At prompt "slot to copy into", type 15 press RETURN.

You now have a system library in Pascal to execute a Fortran 1.0 program. When you want to execute a Fortran 1.0 program, first copy .d2/flib into Pascal3/system.library and then execute the Fortran.1.0 code. When you want to run Pascal, first copy .d2/plib into Pascal3/system.library.

MEMO FROM ON THREE

SUBJECT: TECHNICAL SUPPORT
DATE: JULY 1, 1987

ON THREE, Inc. warrants all of its products and offers full technical support for a period of up to ninety days. This has always been our policy and we will continue to help our valued customers as much as we can. However, of late, the abuses to our limited technical staff have been overwhelming. Every day we receive dozens of calls from /// users with questions on products that were bought years ago, questions on software the caller frankly admits he/she has copied from a friend or other source "but doesn't have the manual and can you step me through the program?", calls concerning products that were purchased from companies and dealers that have gone out of business or refuse to support Apple /// products. We receive calls from Apple /// users who insist that because Apple, Inc. or their dealers won't assist them, we must help them with products that are not even ours,"because ON THREE is the only company still supporting the Apple ///." The majority of these calls come in over our toll free order line, which is toll free *only* because ON THREE is paying for the call! Our phone bills have been positively astronomical! All of this free technical support has put tremendous strain on our limited time and resources. ON THREE is not subsidized by Apple, Inc., as many people believe. If ON THREE is to survive financially, and stay in a position where we will be able to continue to develop new hardware, software and programs for the Apple ///, we must regretfully change our present policy of unlimited free technical support because quite frankly, we can no longer afford to do so. Because of these circumstances we are forced into the position of having to change our rules concerning free technical support on certain products: Effective immediately:

ON THREE will no longer offer unlimited, FREE help and assistance on products that:

1. Were not purchased from ON THREE.
2. Are not ON THREE products.
3. Were obtained from an unauthorized source.

If your call falls into any of the above categories, we will still try to assist you to the very best of the ability of our staff. However, at the start of your call, which must be made *only* to the 805-644-3514 line, we must ask you to give your credit card number and expiration date. You will be charged at the rate of \$5 for the first three minutes and \$1 per minute for each additional minute thereafter.

THANK YOU FOR YOUR UNDERSTANDING AND COOPERATION

The following excerpts concerning the technical assistance offered by other companies is from an article titled, "EASY LISTENING ON THE SOFTWARE CIRCUIT", by editor George Gendron. This story appeared in the February 1985 issue of INC. magazine.

"Even the expense of making long distance phone calls to software publishers would be tolerable, except that getting through to a consoling voice often strains the bounds of patience.

Ashton-Tate: Called and got right through but was transferred to a recording that advised me to have software serial number ready and described A-T's commitment to the customer. Message prattled on for a good 80 seconds. No support was forthcoming, only Easy-Listening' FM. Was listenin' uneasily to "Try to Remember (the kind of September)" when a voice interrupted, "Our support technicians are still busy." Kept holdin'. Twelve minutes later, still no surcease; lots of hearts and flowers, though. Hung up. Elapsed time; still tickin'.

Context Management Systems: Picked the phone right up. No wonder there was such speed. The company no longer offers technical support. "Try the dealer you bought it from," I was told. Elapsed time: 8 seconds.

BTI SYSTEMS: The line was busy 10 straight times. At last a recorded voice answered: "All our support representatives are currently busy," Held the dead line for 2 minutes. Finally a *real* voice answered, "All of our support representatives are currently busy." Left name and phone number. Was called back in half an hour. Elapsed time: 40 minutes.

IBM: They answer questions like everybody else - except their support can cost \$40 a query."

ON THREE News

An Important Personal Message From Bob Consorti, President of ON THREE

For the last four years ON THREE has been satisfying Apple /// users with virtually all of their /// needs. From being the only company to continue producing new products for the venerable old Apple ///, to giving everyone tens of thousands of dollars worth of **FREE** technical assistance, we've been here when you needed us.

Well friends, the state of the /// is not so well these days. People simply have not been purchasing enough of our products to keep us going as an Apple /// business. We've been diversifying over the last year and now have products for the //e and //GS, but...Our first love was the Apple /// and we would dearly love to continue creating new products and supporting it. The time is at hand when you will now decide the fate of your machine. We need **YOUR** support today.

ON THREE simply can't afford to continue doing Apple /// business unless you begin buying more of our products. If you placed one of the thousands of calls for technical assistance which we've answered - concerning problems with other company's products (or our own); we need you to stand up and say that you would like ON THREE to continue serving your Apple /// needs.

Please state your conviction by purchasing as many products as you can. If enough people order today, we will be here for you tomorrow - and the next day...

Realizing that we have to entice you, we're offering **FREE** gifts and unheard of sale prices on virtually all of our products. If you've been procrastinating, please look through this magazine and pick out something you've wanted but never got around to buying. Now is the time to buy! Prices have never been this low!

If you're one of the people who have 'black-market' copies of our software - look at our prices! Get the real thing today and learn how to get the most out of our products. You'll feel better about things - and we'll be here the next time you call asking a question only a few people in the world know how to answer.

Please pick up the phone and order today. It's so easy! We have toll-free 800 numbers so the call won't cost you a penny. All you have to do is order a few of the products you've been holding out for. We implore you not to wait any longer. So please, pick up the phone and dial in a nice big order today. If enough orders come in and we continue to receive your support, ON THREE will always be here for you.

Last but definitely not least, we want to thank each and every one of you who have given your support to us in the past. We look forward to providing the products and services you will need for the next four years.

Sincerely,

Bob Consorti
President
ON THREE, Inc.

P.S. Please check out our latest and greatest new products. My favorites are **The Communications Manager (TCM)** and the **Super Accessories Disk #1**. A very important new service is our **Memory Board Insurance**.

TCM is a first and *only* full feature communications package for your Apple /// that supports the powerful XMODEM and Binary II file transfer protocols. It allows **ERROR-FREE** transmission of files on the Apple /// and offers virtually all of the features of the other communication packages for the /// - and then some!

The **Super Accessories Disk #1** is a set of useful accessory add-ons for the Apple /// version of The Desktop Manager. It contains the most asked for accessories to date. Please check it out, you'll be glad you did.

ON THREE Magazine - The ONLY Monthly Apple /// Magazine!

Of all the products you may order today, one should be at the top of your list - **ON THREE Magazine!** At just **\$40** for a full 12 issue subscription, it simply can't be beat. It's packed full of timely articles that you can't afford to miss.

The best way to get the most out of your Apple /// is through **ON THREE Magazine**. It's the *only* monthly magazine devoted to the Apple ///. Order today and get **ON THREE Magazine** delivered to your mailbox each and every month for an entire year.

Timely reviews and a variety of special sections for programming make **ON THREE** the *only* choice for your Apple /// magazine needs. Place your subscription order now and get any single back issue - **FREE!**

The Future Of ON THREE

If we can't generate enough revenue as an Apple /// company to keep going as we currently are, a number of changes will take place. First and foremost, we will still be here and you will still be able to order products from us. However, the level of service that you have grown accustomed to will change dramatically.

We will not be able to afford to keep support personnel around to answer your numerous questions. Our many product development efforts will all have to be cancelled. This means that **ON THREE** will not be able to bring you any more new software or hardware items and will not be able to answer questions as freely as we have been.

The one thing that will remain the same is **ON THREE Magazine**. The only monthly magazine devoted to the Apple /// will remain as long as /// people continue reading it. We will keep the quality of the magazine intact.

We have a number of exciting products planned for the /// but without your support we will not be able to complete them. The **Spelling Checker for /// E-Z Pieces**, **SOS** and **Pascal updates**, **Speed-Ups** with the 65C802 chip, **Hard Disk Tape Backup** and more are all in the works. If you want **ON THREE** to continue supporting your Apple ///, when all others have dropped it - please phone in your order today!

If you want to continue getting the most out of your trusty old Apple ///:

Please Support ON THREE Today!

Ordering Information

To order any **ON THREE** product, call our toll-free order line or simply send a check or money order to the following address:

ON THREE, Inc.
Attn: Order Department
4478 Market Street, Suites 701-702
Ventura, California 93003

The Toll-Free Order Lines

(800) 443-8877 or (800) 331-1418 in California

If you would like to place an order, simply call the above numbers from 9AM to 5PM Pacific Standard Time. We accept Visa, MasterCard & American Express.

The above numbers are for orders only. The people answering them can't answer technical questions and they can't transfer you to someone who can. We've been getting an unbelievable number of calls of late on the order lines - but they haven't been for orders, they've been for technical support.

We simply can't afford to answer questions and pay for the call! It costs us money each and every time you call and place orders, or call for technical assistance on the 800 line.

If you have any questions about the Apple ///, you must call on the (805) 644-3514 number. If you have an order, please use the special Toll-Free numbers. If people keep abusing this service it will be discontinued and everyone will lose.

The *Call Three: Hot Line* is a service whereby Apple /// users with questions can call an area number for answers. The individuals answering your calls are fellow Apple /// users who volunteered to help those in need over some of the rough spots. They are not compensated for this service, so we owe them a resounding "three cheers" for their kindness and generosity.

If you are willing and able to aid others by answering questions, please write to *ON THREE* and provide the necessary information. If you have questions, feel free to call our consultants listed below. Please observe the calling hours shown and, before placing a call, double-check the time zone so you don't inadvertently awaken someone! No other restrictions apply to this service.

For your reference, the accompanying table lists subjects and abbreviations used in the "Subjects" column of the consultant listing.

The Desktop Manager

\$129.95

plus \$6.00 s/h

This is the most complete and sophisticated desk accessory program ever written! Finally you can unclutter your desk the Desktop Manager way. The Desktop Manager places all of the desk accessory utilities you need -- appointment calendar, notepad and calculator -- within every program you own, so you can use them as if they were a part of your original programs. While you are using your program, you cannot see the Desktop Manager. However, by pressing only two keys the Desktop Manager menu appears, ready for your use from within *any* application!

While word processing, have you ever needed to multiply two numbers? Or have you suddenly remembered while in the middle of a spreadsheet the name of that stock your broker suggested, but have no pen or paper nearby to jot it down? Perhaps you've forgotten your spouse's birthday again, although you did write the date on a piece of paper you keep in your desk. Why not increase your productivity while you clear your work area of that old-fashioned calculator, pens and paper scraps, and unnoticeable appointment calendar? With the help of *ON THREE's* Desktop Manager, you can do all this and more.

From within any program, two keypresses override and freeze your current application and display a window containing the Desktop Manager's main menu. Now you have the power of all of the Desktop Manager's options at your command. Simply select one of the following standard Desktop Manager features:

Appointment Calendar - Set multiple appointments daily through December 31, 1999. As your appointment is due, a reminder appears on your screen regardless of what application you're using. The daily and weekly appointments are shown at a glance and, as with all Desktop Manager options, help screens are only two keystrokes away.

Appointment Calendar

3 July 87 8:13:01 AM SUN MON TUE WED THU FRI SAT

You have 2 appointments scheduled for today.

Open Apple ? Key For Help.

Calculator - A powerful electronic workhorse, the Calculator has full 16-digit accuracy and advanced functions such as SIN, COS, TAN, LOG's, x to a power, square root pi, memory and base conversions in addition to the basic add, subtract, multiply and divide functions. Also, you can invoke a simulated scrolling paper tape for printing later or pasting into another document.

Super Desktop!

That's right! ON THREE's new Super Desktop Manager™ Accessories Disk No. 1 is worth jumping off skyscrapers for. But don't go that far, just call ON THREE's order line today!

The Accessories Disk contains:

- ***Printer Setup** - Allows you to send complex control codes to your printer via easy to use menus.
- ***TypeWriter** - Turns your Apple III into an intelligent typewriter.
- ***Labeler** - Prints labels you define, one at a time or even multiple copies.
- ***New Desktop Setup** - Allows better control over the ClipBoard.
- ***Make Subdirectory** - The one we forgot in the Disk Manager.
- ***Screen Dump** - Prints a copy of your current text screen at any time.
- ***Menu Manager** - gives the Desktop Manager's main menu submenus, so you can have an infinite number of accessories on your trusty old Apple III.

There are so many accessories on this disk, we think there's something for everyone! If you have the Desktop Manager now, you need this disk!

Priced separately, they would cost over \$250. On this special disk, though, you can indeed FLY HIGH with a \$39.95 price tag plus \$2 shipping and handling!
