Apple II: Transferring Data to the Macintosh

=====

This article last reviewed: 23 June 1990

TOPIC -----

Can the Apple 5.25 PC Drive (and card) read ProDOS 5.25-inch disks under AFE?

DISCUSSION -----

Apple 5.25 PC Drive only supports disks that are formatted using the MFM encoding methods. Therefore, it does not read ProDOS-formatted disks, which use GCR. Alternative ways to move data from the Apple II to the Macintosh include AppleShare, a serial link (cable and/or modem), and by first moving the ProDOS data to 3.5-inch disks, which any Macintosh will mount.

You may find the AFE Works-Works translator helpful when actually translating the files. It is on the InfoSource CD-ROM available from Apple.
