INTRODUCTION

Las Vegas, Nevada: a glittery mecca of hotels and casinos in the middle of the desert where fortunes are won and lost at the turn of a card. VIDEO VEGAS brings authentic casino action to your home computer in colorful animated graphics. The games look and work exactly like the video slots in the Las Vegas casinos.

VIDEO VEGAS entertains the beginner and challenges the pro. It is perfect for your next party or sharpening your gambling skills before that Las Vegas holiday! If you are already familiar with casino games, just boot up the disk and play. For a more detailed description of the games and playing strategy, take a few minutes to read through this manual. The section on Blackjack contains valuable information that could help you become a winner on that next trip to the casino. Have fun and good luck!

EQUIPMENT REQUIRED

- 1) Apple IIc, IIe, or II+ with at least 64K.
- 2) Monitor or TV

Getting Started - THE VEGAS STRIP

Place the VIDEO VEGAS disk in drive 1 (label facing up) and turn on the computer. You will see an animated view of the Vegas Strip, with the casinos in all their neon splendor. Press the **SPACE** bar to see the menu of VIDEO VEGAS games. You will start with a bankroll of \$1000. Use the arrow keys to highlight the game you want to play and press **RETURN**. When you are finished playing a game, press the **ESC** key to return to the Vegas Strip and the MAIN MENU. Your bankroll (win or lose) will go with you when you change from one game to another.

LUCKY 7 SLOT MACHINE

When you first walk into any casino, the first thing you see are the slot machines. They seem to be everywhere, with people dropping coins into the slot and pulling the handle as fast as they can. Slot machines have earned the name *one-armed bandit* for their reputation of taking a lot more money than they pay back! With this reputation, you might wonder why so many people play slot machines? The answer is simple; people play slots because they are fun. It is hard to resist these glittery machines with spinning reels of cherries, plums, bells, 7s, bars, etc. The clink-clink-clink of silver dollars falling when someone hits a jackpot can be heard halfway across the casino.

The LUCKY 7 slot machine in VIDEO VEGAS is the classic 3-reel dollar slot found in every Las Vegas casino. You can bet from 1 to 3 dollars by pressing the number keys **1**, **2** or **3**. You can also press **SPACE** or **RETURN** to play without changing the bet. The coins will fall into the slot and the handle will drop setting the reels in motion. The reels spin and stop one at a time. If you hit a winning combination, the machine drops your winnings into the tray at the bottom. A list of the winning combinations and payoffs can be seen by pressing the **?** key. The rate of payoff is approximately 98% which means the machine pays back roughly 980 dollars for every 1000 dollars put into it. These odds are about as good as you will find anywhere in Las Vegas.

DRAW POKER

The VIDEO VEGAS DRAW POKER game is just like the video poker machines that you find alongside the regular slot machines in the casino. You can bet 1 to 5 dollars by pressing number keys from **1** to **5**. You can also press **RETURN** to play without changing the bet. You are dealt five cards face up. The object of the game is to get a winning poker hand. You can discard as many of the original five cards as you like and *draw* new ones to improve your hand. Use the **←** or **→** keys to select any card you want to discard and press the **SPACE** bar to turn it face down. If you accidentally select a card that you want to *hold*, press the **SPACE** bar again to turn it face up. When the discards are selected, press **RETURN** to deal the new cards. You win when you have one of the hands shown below. Press the **?** key to see a list of the payouts for each hand.

Here is a description of the winning poker hands, a Royal Flush is the highest and a Pair is the lowest:

ROYAL FLUSH - Ten, Jack, Queen, King, and Ace all of the same suit.

STRAIGHT FLUSH - Any five consecutive cards all of the same suit. Example: 3, 4, 5, 6, and 7 of spades.

4 OF A KIND - Four cards of the same rank (number).

FULL HOUSE - Three cards of one rank and two cards of another rank. Example: 3 Jacks and 2 Nines.

FLUSH - Any five cards of the same suit.

STRAIGHT - Five consecutive cards of mixed suits.

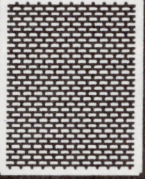

3 OF A KIND - Three cards of the same rank.

2 PAIR - Two cards of one rank and two cards of another rank. Example: 2 Kings and 2 Fours.

PAIR - Two cards of the same rank. Only pairs of Jacks or better (Jacks, Queens, Kings, and Aces) are winners.

KENO

The game of Keno is similar to Bingo in that the object of both games is to match numbers on a card with numbers drawn at random. The big difference is that the numbers on a Bingo card are preset, but in Keno you choose the numbers you think will be winners.

The KENO layout has 80 numbers. You can bet 1 to 5 dollars by pressing number keys from **[1]** to **[5]**. You can also press **[RETURN]** to play without changing the bet. When the bet has been placed, you will be prompted to select or *mark* from one to fifteen of the 80 numbers on the layout. The **[I]**, **[J]**, **[K]**, and **[M]** keys are used to move the cursor around the layout (the arrows keys will work as well). When a number you like is highlighted, press the **[SPACE]** bar to mark the number. A check mark will appear at each selected number. The **[SPACE]** bar is also used to clear a number that is already checked. Use the **[C]** key if you want to clear all marked numbers and start over.

When you have marked the numbers that you think are winners, press **[RETURN]** to play. Twenty numbers will be drawn at random and lighted on the Keno board. Whether you win or lose depends on how many of your marked numbers are *hit* on the draw. For example, if you marked eight numbers, you must hit at least five of them to win anything at all; this pays \$9 on a \$1 bet. If you hit all eight numbers, you win \$20,000 on the \$1 bet. While a 20,000 to 1 payoff may sound pretty good, the odds against hitting all eight numbers is over 200,000 to 1. Press the **[?]** key to see a complete list of all of the payouts.

As it turns out, the odds of winning at Keno are very poor. You will win more often when you mark fewer numbers, but the payouts are much smaller. The big payouts are really a long shot. Fortunately, you can play the VIDEO VEGAS version without risking real dollars!

KENO ODDS

BLACKJACK

Blackjack is one of the few casino games where skill plays an important part in winning or losing. By playing skillfully, you can virtually eliminate the odds favoring the dealer.

The game is simple to play, but there are more rules and options than the other VIDEO VEGAS games. When you select **BLACKJACK** from the MAIN MENU, you will see a screen showing the House Rules. These rules of play are identical to those used in many Las Vegas casinos. The one option that varies from casino to casino is the number of decks used in the deal. You choose the number of decks by pressing a number from **1** to **4**. The cards will be shuffled and you will see the Blackjack table with the deck placed at the right side of the screen. Your current bankroll appears right above the deck. All of the playing options and messages are displayed in the windows at the bottom.

You place your wager before each hand is dealt, the minimum bet is \$2 and the maximum is \$20. Use the *arrow* keys to change the amount of the bet (shown in the upper-left corner). Only even numbers are allowed to avoid small change payouts. You cannot make a bet that is larger than your bankroll. When you have selected the bet, press **RETURN** to deal the hand.

THE DEAL

You (the player) and the dealer are dealt two cards each. The dealer always has one card dealt face down, this is called the *hole* card or *down* card. When you get your cards, you must add up the total of your hand. Each card has a point value. Tens, Jacks, Queens, and Kings are worth ten points each. Aces can be counted as one or eleven points. All other cards are counted at face value; a Three is worth three points, a Seven is worth seven points, etc.

The object of the game is to get a hand that totals 21 points, or as close to 21 as possible without exceeding 21. When you exceed 21 points, you *bust* (lose automatically). If you do not bust, and your total is higher than the dealer's total, you win the amount of the bet. For example, a \$2 bet would win \$2. If your total matches the dealer's total, you tie (or *push*) and neither win nor lose the bet.

NATURAL BLACKJACKS

If your first two cards add up to 21 exactly (an Ace and any ten-value card), you have a *natural Blackjack* which is an automatic winner. Not only do you win, but the payoff is at three to two odds! You win \$3 on for each \$2 bet. Your natural Blackjack cannot lose, but it can be tied by a dealer natural. When the dealer has a natural Blackjack and you do not, you lose even money (a \$2 bet loses \$2) unless you have made an *Insurance* bet (which will be explained later). All natural Blackjacks are settled immediately and you go on to the next hand.

PLAYER'S OPTIONS

When no natural Blackjacks appear on the deal, it is your turn to choose one of the following options:

- 1) Press **[RETURN]** to "stand" or stand pat. This means you are satisfied with the cards in your hand and do not want any more.
- 2) Press **[SPACE]** to "hit" or draw another card. You should take a hit when you are not satisfied with the point count of your hand. The dealer will give you another card each time you press the **[SPACE]** bar. When you are happy with your hand, press **[RETURN]** to stand. You can take as many cards as you want as long as the total does not exceed 21. If you take a hit and exceed a total of 21, you *bust* and lose automatically. The bet will be deducted from your bankroll and you will move on to the next hand.
- 3) Press **[D]** to "double" or double down. With this option the amount of the bet is doubled and you receive *one* additional card. You will not be allowed to take more than one card. This is a very good bet when your first two cards total 11 points.
- 4) Press **[S]** to "split" your hand. This option is available only when your first two cards are a pair. The pair of cards is split into two separate hands (*Hand 1* and *Hand 2*) and the bet is doubled (since you will be playing two hands). The dealer will hit the first card of your pair. You can stand, hit, or double just as you would with hands that are not split. You cannot re-split a pair on a hand that has already been split once. When *Hand 1* is completed, play moves on to *Hand 2*. If you split a pair of Aces, you will receive only one card on each of your Aces. Also, if either of your Aces is dealt a ten-value card, you do not have a natural Blackjack. *The only time you can have a natural Blackjack is on the initial deal.*

DEALER'S OPTIONS

After you have acted on your hand, it is the dealer's turn. The dealer will expose his hole card and play according to the following rules:

- 1) If the dealer's point count is *less* than 17, he must take additional cards until the total is at least 17.
- 2) When the dealer total is *17 or more* (with Aces counted as 11), the dealer must stand.
- 3) If the dealer busts (and you have not), you win automatically.

When the dealer is finished with his hand, the wager is settled. If your point total is higher than the dealer's, the amount of the bet is added to your bankroll. If the dealer's total is higher, the bet is subtracted from your bankroll. When the totals are equal, you push and the bankroll is unchanged.

INSURANCE

When the dealer's up card is an Ace you will be asked if you want *insurance* against a dealer Blackjack. This is an additional wager of half of your original bet. You are betting on whether or not the dealer has a natural Blackjack. Press Y to take the insurance bet or N to decline.

If you take the insurance bet and the dealer's hole card is a ten-value, he will show his natural and you lose your original bet (unless you push), but you do win 2 to 1 odds on your insurance bet. If the dealer does not have a natural, you lose the insurance bet and the hand is played out in the usual manner. In the long run, a player will win more by *never* taking an insurance bet (unless he is an expert card counter).

BLACKJACK STRATEGY

There have been numerous books written on the strategy of winning Blackjack. Even though the game is simple to play, the correct decision of whether to hit, stand, double, or split is often very subtle and difficult. You must take into account not only your own hand but also the card showing in the dealer's hand as well. Expert Blackjack players even keep track of the cards as they are dealt so they can estimate the probability of high or low numbers remaining in the deck. You may not want to go to that extreme but there are some things you should consider if you want to improve your winnings.

A hand that contains an Ace can be counted two ways. For example, an Ace and Eight total either 9 or 19 points depending on whether you count the Ace as one or eleven. Any hand that can be counted two ways is called a *soft count*. A hand that can be counted only one way (without busting) is called a *hard count*. A soft count gives you more flexibility because you can take a hit without busting the hand.

Whenever you are dealt an initial hard count of 12, 13, 14, 15, or 16, your chances of winning the hand are poor because you are likely to bust if you take a hit. Yet if you don't hit, you cannot beat the dealer (unless he busts). Likewise, if the dealer's up card is showing a Three, Four, Five, or Six, his chances of winning are reduced. It is these combinations of player count and dealer up card that are the most difficult to play correctly.

Here are some guidelines to follow when playing your hand:

- 1) Stand on hard counts of 17 or more.
- 2) Stand on hard counts of 12 to 16 if the dealer's up card is Two through Six, otherwise hit on these counts.
- 3) Double on a count of 11 always. Double on 10 unless dealer is showing a ten-value or an Ace. Double on 9 when the dealer is showing Two through Six.
- 4) Always hit hard counts of 10 or less except when it is appropriate to double.

- 5) Always split a pair of Aces or Eights. Never split a pair of Fours, Fives or Tens. Generally split other pairs when the dealer is showing Two through Six.
- 6) Always stand on a soft holding of Ace-Eight or Ace-Nine.
- 7) On other soft counts, you should hit. If the dealer is showing a Three, Four, Five, or Six, you should consider doubling.

This basic playing strategy will not automatically make you a winner, but it can improve your chances. *Remember, the odds are stacked in favor of the casino.*

CARD COUNTING

Expert Blackjack players always use some type of card counting system to improve the odds. It has been proven that a player can gain an advantage over the casino by keeping track of the cards that are played and modifying his basic playing strategy based on the cards remaining in the deck.

The details of card counting vary from one system to another, but the basic theory is the same for all. The player's chances of winning depend on the cards remaining in the deck. When the deck has an unusually high proportion of Aces and ten-values, the player has a slight advantage. When the deck has more low cards (Twos through Sevens) than high cards, the casino has the edge. A deck that is rich in Aces and ten-values is more likely to produce natural Blackjacks or pat hands (19 or 20) on the next deal. The dealer and player have an equal chance of getting one of these winning hands, but only the player gets paid 3 to 2 odds on a natural. The player can also *double* on a 9, 10, or 11 count knowing that there is a better chance of receiving a 10. The dealer must take a hit on 12 to 16 and therefore is more likely to bust when the deck is rich in ten-values. By adjusting the basic playing strategy, increasing the bet when the odds are favorable, and making a minimum bet when the odds are poor, the player will profit in the long run.

It is impossible to remember every card that has been played, so you should select a system that is easy to use and remember. In the simpler systems, the player counts only the Aces and ten-values. There are 52 cards in each deck with 4 Aces and 16 ten-values. If half of the deck has been played but less than 8 ten-values were dealt, then the remaining cards are rich in ten-values, giving the player an advantage. If more than 8 ten-values were dealt, the remaining cards favor the dealer. Likewise, you would expect to see one Ace for every thirteen cards played. If more than thirteen cards are dealt without an Ace appearing, the remaining cards are rich in Aces. When the deck is rich in *both* Aces and ten-values, the player should double or triple his bet.

A more accurate card counting system is to assign a plus or minus value to certain cards and then keep a running point-count as the cards are played. In this system Aces and ten-values are worth *minus* one (-1). Threes, Fours, Fives, Sixes, and Sevens are worth *plus* one (+1). Do not count Twos, Eights, or Nines. When the cards are shuffled, the running count starts at zero. As the cards are played, the count will be plus or minus depending on the cards dealt. A positive running count (+5 or more) indicates a deck that is favorable to the player. When the running count is negative (-5 or less), the deck favors the dealer.

VIDEO VEGAS BLACKJACK has a special built-in feature to help you learn card counting. Before each hand is played, you can press the key to get a status report of the running point-count and the cards that have been played. The following information will be displayed briefly at the bottom of the screen:

1 DECK BLACKJACK
NUMBER OF CARDS PLAYED: 22 COUNT: +1
TENS: 4 ACES: 3 FIVES: 1

HACKER NOTES

The VIDEO VEGAS programs were written in BASIC using the **TAKE 1 Programmer's Toolkit**. All of the graphics and animation were created with **TAKE 1, BLAZING PADDLES**, and **PIXIT**. Since Hacker Jack programs are written in BASIC, they provide a great opportunity for users to learn advanced programming techniques by listing and examining the programs. If you are a serious hacker, you can even customize the programs by changing the graphics or program code.

To list a program, press **CTRL-RESET** when the program menu is on the screen. There are six BASIC programs on the disk. They are **HELLO, VEGAS, LUCKY7, POKER, KENO, and BLACKJACK**.

You will need **TAKE 1** and the **Programmer's Toolkit** (available from **BAUDVILLE**) if you want to make custom changes to the VIDEO VEGAS programs. Don't make any modifications to the original program disk. Instead, make a Moviedisk with the Toolkit and copy all of the files from the VIDEO VEGAS disk to the Moviedisk. The bootup movie is **MV.JACK** and the bootup program is **HELLO**. The **HELLO** program sets the bankroll at \$1000 and then runs **VEGAS** which is the main menu program.

Here are some suggestions for program changes:

To change the starting bankroll, you must modify the **HELLO** program. The bankroll amount (in thousands) is **POKE**d into memory at **LINE 40**. Use a number from 1 to 9 to set the amount you want. For example, if you change **LINE 40** to **POKE 44796,5** you will start with a \$5000 bankroll.

A more interesting modification is to change the reels on the **LUCKY 7** slot machine. This will alter the payoff odds dramatically and can make the slots a winning proposition. The symbols on the reels are set by **DATA** statements in lines 20200 to 20400 at the end of the program. To change the reels, just change the numbers in these **DATA** statements. There are six different symbols so use numbers from 1 to 6. There must be a total of 19 numbers in each **DATA** statement.

Hacker Jack: The Spirit Lives On

Man has always embraced the spirit of Hacker Jack. It's the spirit of discovery . . . of invention . . . of adventure; the force that has taken us from Columbus to the Wright Brothers to Sally Ride.

Hacker Jack is the symbol for those who possess this endless desire to learn and create. That's why Hacker Jack software is designed for and dedicated to the hacker in all of us.

**Who is Hacker Jack?
He might be you.**
